Samenvatting

In dit werkdocument wordt een overzicht gegeven van de lozingsbronnen en de belasting op de Westerschelde door vijftien stoffen of parameters in de periode 1980 tot en met 1993 en van vijf organische microverontreinigingen in de periode 1983 tot en met 1993.

De basisgegevens zijn, in het kader van het project SCHOON/SAP, verzameld en geschikt gemaakt als input voor het waterkwaliteitsmodel van het Schelde-estuarium. Binnen dit model is het gebied, vanaf Rupelmonde (B) tot Vlissingen (NL), verdeeld in 14 segmenten met een uitbreiding van de kustzone. De Westerschelde vanaf de grens België/Nederland tot de lijn Vlissingen/Breskens beslaat de segmenten 6-14.

Met deze gegevens is de belasting op de Westerschelde berekend en wordt onderscheiden in categorieën. De belasting ten gevolge van de lozingen worden a) per bron, b) per segment met het relatieve aandeel per categorie, c) van de Westerschelde met het relatieve aandeel per segment en d) van de Westerschelde met het relatieve aandeel per categorie gepresenteerd. Verder wordt de belasting bij de grens gegeven.

BIJLAGE 2 Overzicht lokaties waarvan de belastingen berekend zijn		152

1. Belasting met zuurstofbindende stoffen, nutriënten, zware metalen en organische micro's.

1.1 Inleiding

In eerste instantie is een emissie-database van het Schelde-estuarium opgebouwd voor de periode 1980 - 1987, met later een aanvulling van 1988 [lit. 1, deel I]. De tweede aanvulling van dit gegevensbestand, met gegevens over de jaren 1989 - 1991, vond plaats in 1992 [lit. 2,3 en 4]. De laatste aanvulling is die met gegevens van 1992 en 1993 [lit 6,7 en 8]. De gegevens in de periode vóór 1992 werden verzameld en gerapporteerd van Belgische én Nederlandse lozingen vanaf Rupelmonde (B) tot Vlissingen (NL). Vanaf 1992 zijn geen Belgische gegevens beschikbaar omdat in het kader van het LIFE-project de afdeling Hydrologie van de Vrije Universiteit Brussel hiervoor verantwoordelijk was. Vandaar dat, in tegenstelling tot voorgaande rapportages [lit. 1, deel II en lit. 5], in dit werkdocument de omvang van de belasting door de verschillende bronnen als polders, kanalen, huishoudens, industrie en neerslag, die met de bestanden valt te berekenen, enkel in het Nederlandse deel van het Schelde-estuarium, de Westerschelde, over de jaren 1980 - 1993 gegeven wordt. Daarbij is onderscheid gemaakt in de debieten en de belasting met zuurstofverbruikende stoffen en zwevend stof, nutriënten, zware metalen en organische microverontreinigingen.

1.2 Keuze periode, lozingscategoriën en parameters.

De berekende belastingen beslaan de periode 1980-1993, die van de organische microverontreinigingen de periode 1983-1993. De keuze van de parameters zijn dezelfde als de parameters, die gebruikt worden bij het waterkwaliteitsmodel Schelde-estuarium aangevuld met het chemisch zuurstofverbruik en inwonerequivalenten. De met een * gemerkte stoffen in tabel 2, zijn gemodelleerd. De debieten en het zwevend stof worden door het model als invoer gebruikt. Voor de modellering van de organische microverontreinigingen zijn de volgende stoffen gekozen: twee PAK's: benzo(a)pyreen en fluorantheen, twee PCB congenere: PCB-52 en PCB-153 en een bestrijdingsmiddel gamma-hexachloorcyclohexaan of te wel lindaan. In het nieuwe LIFE-model [lit. 8] zijn een aantal uitbreidingen aangebracht betreffende gebied en parameters. Het model is uitgebreid met de kustzone, dit is het gebied buiten de lijn Vlissingen-Breskens. De uitbreiding van de parameters betreft een aantal pesticiden nl. atrazine, dichloorvos, diuron, mevinfos en simazine. Van deze uitbreidingen zijn geen gegevens opgenomen in dit werkdocument. Zie voor gegevens hierover [lit. 8].

De belastingbronnen zijn onderscheiden in een aantal categorieën. Deze categorieën zijn in tabel 1 gegeven. Op bijlage 1 en 2 achteraan dit werkdocument is de schematisatie van het model met de namen van de lokaties gegeven. In tabel 2 zijn de parameters opgenomen.

Tabel 1. Opsplitsing in categorieën

Categorie 1 = polders
Categorie 2 = kanalen
Categorie 3 = communaal
Categorie 4 = industrie
Categorie 8 = neerslag per segment

Tabel 2. Keuze van de parameters waarvoor de belastingen zijn berekend.

Debieten * Biochemisch zuurstofverbruik; 5 dagen 20 gr.C Chemisch zuurstofverbruik	afvoer BZV5 CZV
Inwonerequivalenten Zwevende stof; gedroogd bij 105 gr.C	IE's Zwst
* Ammonium * Kjeldahl stikstof * Nitraat + nitriet * Totaal-N * Silicaat; opgelost * Ortho-fosfaat * Fosfaat; totaal	NH4-N Kjdl-N NO3NO2 Tot-N Opg-Si PO4-P Tot-P
* Cadmium; totaal * Chroom; totaal * Koper; totaal * Zink; totaal	Cd-tot Cr-tot Cu-tot Zn-tot
* Benzo(a)pyreen * Fluorantheen	Bap Fla
* PCB-52 * PCB-153	PCB52 PCB153
* Gamma-hexachloorcyclohexaan (lindaan)	c-HCH

Hoofdstuk 2 geeft het overzicht per bron en jaar. De lozingen van de algemene stoffen zijn in paragraaf 2.1 vermeld. Hierin is aangegeven in welk segment betreffende bron loost en tot welke categorie deze behoort. De nutriënten komen in paragraaf 2.2, de zware metalen in paragraaf 2.3 en de organische micro's in paragraaf 2.4 aan bod. De belasting van de modelrand segment 6 Schaar van Ouden Doel - grens België/Nederland - wordt behandeld in hoofdstuk 3. In de hoofdstukken 4-6 worden behandeld: "De belasting per segment met procentueel aandeel per categorie"; "De belasting van de Westerschelde met procentueel aandeel per segment" en "De belasting van de Westerschelde met procentueel aandeel per categorie". Voor meer inhoudelijke zaken is in hoofdstuk 7 een literatuurlijst opgenomen. De storting van afvalgips door Zuid-Chemie in de Westerschelde bij Terneuzen (vak 13) is in de belasting meegenomen in categorie 4. Een overzicht hiervan is in tabel 3 gegeven. Voor cadmium en zink zijn de in tabel 3 vermelde gemiddelde belasting gebruikt. Na 1983 is dit type lozing in Nederland gestaakt.

Tabel 3. Verontreinigingen gipsstortingen voor Terneuzen in de periode 1980-1983

jaar	gips ton	fosfaat kg	cadmium			chroom kg	koper kg	zink		
			min kg	max kg	gem kg			min kg	max kg	gem kg
1980	176600	529800	353.2	706.4	529.8	1766	1059.6	3532	7064	5298
1981	152400	457200	304.8	609.6	457.2	1524	914.4	3048	6096	4572
1982	124900	374700	249.8	499.6	374.7	1249	749.4	2498	4996	3747
1983	830	2490	1.66	3.32	2.49	8.3	4.98	16.6	33.2	24.9

Van de organische micro's zijn maar weinig gegevens beschikbaar. Het gevolg is dat vanaf 1980 tot en met 1982 geen belastingen konden worden berekend.

Voor het opstellen van de jaaremmissies is uitgegaan van dezelfde lozingspunten als voor zuurstofverbruikende stoffen, nutriënten en metalen.

Om de organische microverontreinigingen zo goed mogelijk te berekenen zijn de ontbrekende zijdelingse belastingen per bron als volgt tot stand gekomen:

- De gebruikte concentraties in de neerslag zijn ook voor de gehalten van polderwater aangehouden.
- Voor het Spuikanaal-Bath zijn de gemiddelde concentraties aangehouden uit metingen in het Volkerak en bij de Kreekraksluizen. Daar het Kanaal door Zuid-Beveland en het Kanaal door Walcheren, wat betreft de waterkwaliteit vergelijkbare kanalen zijn, zijn ook hiervoor deze concentraties aangehouden. Voor het Kanaal van Gent naar Terneuzen zijn tot en met 1988 meetgegevens aanwezig. Vanaf 1989 zijn schattingen vanuit de voorgaande jaren gebruikt.
- Voor zover er voor rioolzuiveringsinstallaties concentraties ontbraken zijn hiervoor maximale emissiefactoren voor de Nederlandse installaties gebruikt. Deze worden uitgedrukt in mg per i.e. Voor benzo(a)pyreen is dit 1,4 mg, voor fluorantheen 4,8 mg, voor PCB-52 0,1 mg, voor PCB-153 0,7 mg en voor c-HCH (lindaan) 12,1 mg per i.e. per jaar. Vanuit de aldus verkregen jaarbelastingen en de gemiddelde jaarafvoer zijn de gemiddelde jaarconcentraties teruggerekend.
- De concentraties in ongezuiverd huishoudelijk afvalwater zijn uit deze maximale emissiefactoren afgeleid. Deze concentraties zijn berekend met een retentiewaarde van 90% ten opzichte van gezuiverd rioolwater. Dit betekent dat de ongezuiverde concentratie van een stof tien maal zo groot is als de berekende gezuiverde concentratie van die stof.
- Van de bedrijven zijn geen aanvullende schattingen gemaakt. Deze worden met betrekking tot de WVO-vergunningen redelijk bemonsterd. De overige bedrijven worden geacht geen van de onderzochte organische microverontreinigingen aan het proceswater toe te voegen.

In hoofdstuk 3 staan de belastingen op de rand van segment 6 (Grens België/Nederland Schaar van Ouden Doel). De belasting op deze rand is mét zoutcorrectie berekend. Een zoutcorrectie is zinvol in die gevallen waarin een vracht wordt berekend uit een gemeten concentratie in het water op een punt waar verdunning van het rivier- met het zeewater is opgetreden. Door op basis van het chloridegehalte de gemeten concentratie om te rekenen naar het gehalte in de zoetwaterfractie en die te vermenigvuldigen met de zoetwaterafvoer, wordt een hogere (maar ook betere) belasting berekend. De correctie bedraagt: $19000/(19000 - C_{cl})$, waarin C_{cl} de ter plaatse gemeten chloride concentratie is.

1.3 Toelichting hoofdstuk 2 tot en met 6

De betekenis van de afkortingen in de hoofdstukken 2 tot en met 6 is als volgt:

- nr : Volgnummer belastingbron (zie bijlage 2).
 bron : Vermeld is de stationscode (zie bijlage 2) waaronder de gegevens van de desbetreffende lozingsbron op computerbestanden staan weggeschreven.
 S(e)g : Het segment (zie bijlage 1) waarop de bron loost.
 Cat : De categorie (zie tabel 2) waaronder de lozingsbron valt.
 IE() : Met de gegevens zijn drie verschillende inwonerequivalent belastingen berekend en wel als volgt:
 $IE(1) = BZV(g/j) / (54 * 365)$
 $IE(2) = Q / 135 * (CZV + 4.57 * KjN)$
 $IE(3) = Q / 135 * (2.5 * BZV5 + 4.57 * KjN)$

De betekenis van de overige parameters staat in tabel 2.

2. Belasting Westerschelde per bron.
