F O R E W O R D

The content of the 1979 edition of the Scottish Sea Fisheries Statistical Tables is largely unchanged from previous years. The tables give considerable detail of landings in Scotland in 1979, by each type of fishing gear, and from each sea area, by UK and by foreign vessels. Some data on the disposal of the catch and the amount processed of the main species is included and the characteristics of the Scottish fishing fleet and details of the numbers of fishermen employed are also summarised in the Tables.

There are 4 new tables in this edition of Scottish Sea Fisheries Statistical Tables.

Table 42 shows Scottish landings, by base district and landing district, and helps to quantify, to some extent, the mobility of the Scottish fleet. For example, North East based vessels land a high proportion of their catch on the West Coast, and Peterhead is used by vessels from West Coast ports, as well as most East Coast ports.

Table 43 gives landings and value by vessel length group and main gear type, and shows the contribution of each vessel length and gear type to the total catch.

Table 39 gives a complete run, monthly, over the last 5 years, of weight and average value of the main species landed in Scotland. This table is a summary of data published monthly by the Department, details of which are available from the address opposite.

The last new table is number 24. This shows changes to the Scottish fleet from 1975 to 1979, including numbers of vessels bought, sunk, sold or laid up.

E X P L A N A T O R Y N O T E S

SPECIES

The various species of fish are divided into 3 main groups; demersal, pelagic and shell fish. Demersal species live on or near the sea bed; pelagic species are found mainly in shoals near the surface.

Landings

Data on landings in Scotland is obtained from sales notes completed at the first auction of the fish, and additional information on effort and grounds is obtained, where possible, by interview with the skippers. The quantities in the tables are expressed in terms of landed weight; in the case of demersal fish (excluding Norway Pout and sand eels) this means head on, gutted fish; for the other species including shell fish it means whole fish.

Vessels (Tables 24, 34, 35, 36, 38)

Data on vessels is obtained from records kept by the Department and updated by reports of officers in the Sea Fisheries Inspectorate based at each of the Sea Fisheries Districts. All vessels actively engaged in commercial fisheries and registered under the Merchant Shipping Act of 1894 are recorded. The base district of a vessel is the district of residence of the skipper or the majority of skippers.

Disposal of fish (Tables 31, 32, 33)

Disposal information is obtained by officers of the Sea Fisheries Inspectorate from information supplied by buyers at the point of sale. The term 'klondyking' refers to direct landings to foreign container or factory vessels for immediate export.

Processing (Tables 25, 26 and 30)

This data is obtained from fish processing plants in each fishery district, by interview or by questionnaire.

Fishermen employed (Tables 37 and 38)

Estimates of numbers of fishermen regularly and partially employed are made at 31st December each year by the Fisheries Officers in each Sea Fisheries District.

Symbols used in tables

The following symbols are used in the tables:

.. = not available.

— = nil.

Explanatory Notes—continued

Rounding

In some tables, where figures have been rounded, the sum of the constituent items may not always agree exactly with the total shown.

FISHING REGIONS

Statistical area (part) of the International Council for the Exploration of the Sea (I.C.E.S.).

I	Barents Sea	VIIa	Irish Sea
II	Bear Island and Spitzbergen	VIIb	West of Ireland
IIIa	Skagerrak and Kattegat	VIId	English Channel, East
IVa	Northern North Sea	VIIe	English Channel, West
IVb	Middle North Sea	VIIf	Bristol Channel
IVc	Southern North Sea	VIIg	South-east Ireland
Vb	Faroës	VIIh	Little Sole Bank
Vla	West of Scotland	VIIj	Great Sole Bank
Vlb	Rockall		

DESCRIPTION OF FISHING METHODS REFERRED TO IN THE TABLES

Motor Trawl. The gear consists of a net in the shape of a funnel attached to the vessel by wire ropes or "warps". As the net is towed over the sea floor the mouth is kept open by a combination of boards, floats and weights. The tail end of the net where the fish are trapped is known as the "cod-end". The length of the warps is normally about 3·5-4 times the depth of the water and can extend in depths of 110m to about 450m from the stern of the vessel. This method is used by the deep sea trawlers operating mainly out of Aberdeen. Other single-vessel trawling methods ("Industrial Trawl", "Light Trawl" and "Nephrop Trawl") follow the same principles. Light Trawl and Nephrop Trawl are used by "Inshore" vessels in the 10m-25m group, many of which are multi-purpose and may also use seine nets (see below).

Two-Boat Trawl ("Pair Trawl": "Mid-Water Trawl"). A variant of trawling used to fish at intermediate depths between the surface and the sea floor. The net is towed by two vessels which may be up to 400m apart, the depth of the net being mainly controlled by the length of the warps and the vessels speed, used by vessels in the inshore fleet for catching both demersal and pelagic species.

Seine Net. Another bottom fishing method. The gear consists of a sac of netting with wings on either side, kept in position vertically by floats and weights. Long warps are attached to the net, one of which is initially fastened to a flag pole passed through a buoy ("dahn buoy"). The vessel steams forward paying out warp, then the net itself, then more warp to form a rough triangle back to the dahn, which may be some 1-3kms distant from the net. The vessel then steams ahead, causing the warps to herd the fish into the path of the net, which is finally winched aboard.

Purse Seine. This method involves complete encirclement of a shoal or area known to contain fish. As the name implies the net, which may be up to 1200m long and 240m deep, is shaped like a purse. One end is first attached to a buoy, and the vessel then steams round the shoal paying out the net as it goes. On return to the buoy the net is closed at the foot or "purse". The net is then winched to the side of the vessel and the fish taken on board by means of a fish pump. This gear requires relatively heavy equipment and is not generally suitable for vessels below 20m; used to catch pelagic species mainly herring, mackerel and sprats. Ring Nets are similar except that the net is much smaller and operated by two vessels. This last method is now uncommon, but still used by a few relatively small vessels on the West Coast of Scotland.

Drift Nets. Sheets of netting each about 35m long and totalling up to 1500m or more are paid out to form a curtain or barrier in the path of on-coming fish (usually herring). The net is kept vertical by floats on the headrope and a heavy footrope, the fish being caught in the mesh by their gills. There are now very few drifters in operation.

Ground Nets are similar except that the nets are anchored near to the sea floor from which they are made to stand upright (by means of floats) like a fence. Occasionally used to catch eg cod off both the West and East coasts of Scotland.

Explanatory Notes—continued

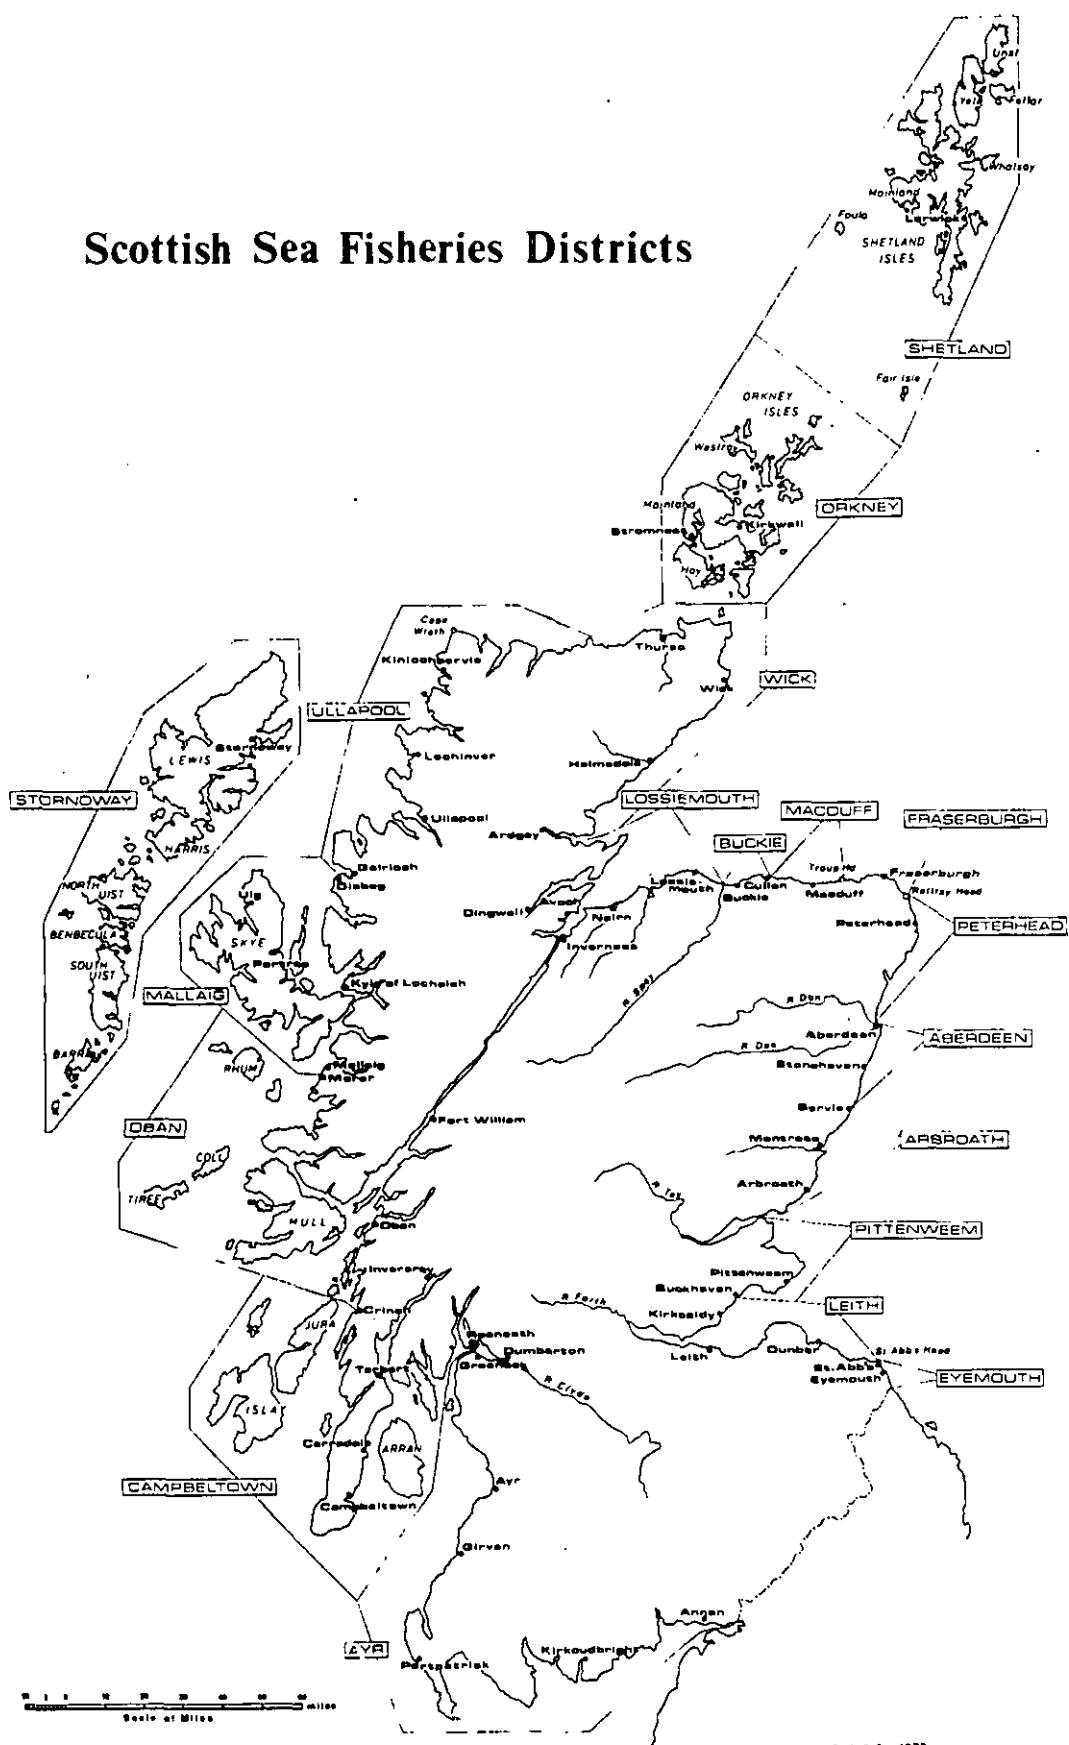

Great Lines. These are lines of thin rope totalling up to 15,000m long with hooks attached at intervals. The hooks are baited and the lines then laid along the sea floor, their position being marked by floats at each end. This method is especially suitable for rocky and uneven grounds where other methods may be impracticable. Used by vessels in the 25m–30m groups, which may be away for up to 3 weeks or more on each trip. There are now few vessels using this method in the Scottish fleet.

Small Lines work on the same principle, but the vessels are smaller and usually return to port every day.

Creels. These are traps or “pots” used to catch shellfish, especially lobsters, nephrops and crabs. The pots vary in size and are generally made from a combination of wood, cane and netting. They are normally arranged on the sea floor in lots between 10 and 50, depending on the capacity of the vessel fishing, and are checked (weather permitting) daily.

Dredge. Used to catch scallops and queen scallops. The apparatus consists of a steel-framed “mouth” attached to a bag of light metal link chain. As the dredge is towed along the sea floor metal teeth attached to the underside of the “mouth” rake the shellfish into the bag. The number of dredges may vary between one and six depending on the power and size of the vessel, which may be up to 20m.
