Preface

The UK Sea Fisheries Statistics are intended to provide a broad picture of the United Kingdom fishing industry and its operations. A note on the methodology used in this publication appears in appendix 2. The content of this publication is also available on the DEFRA website www.defra.gov.uk. Further printed copies of this report can be obtained from TSO (The Stationery Office) at their bookshops or from www.tso.co.uk.

We recommend that you refer to the explanatory notes and glossary of terms which are important in interpreting some of the data.

If you have any comments on this publication or would like more detailed information, please contact:

Explanatory notes

1. The tables refer, as far as possible, to the United Kingdom, including the Isle of Man and the Channel Islands, with separate figures for England and Wales, Scotland and Northern Ireland. In some cases figures for the various parts of the United Kingdom are not strictly comparable and differences are explained in the headings and footnotes of the tables.
2. The figures in the tables in Chapter 3 and 4 for catches and landings are given in terms of liveweight
3. Landings by foreign vessels into the UK include landings by fishing vessels and carriers (if first point of sale of fish). Total imports which combine landings by fishing vessels, carriers and cargo vessels are shown in Tables 4.2, 4.4 and 4.6.
4. Landing figures include a quantity caught by British vessels but not actually landed at British ports. These quantities are transhipped to foreign vessels in coastal waters and are later recorded as exports.
5. The following symbols apply throughout:
 - means "nil"
 - .. means "negligible" (less than half the last digit shown)
 - nd means "no data available"
 - na means "not applicable"
6. Difficulties in collecting complete statistics on shellfish landings mean that available figures may significantly underestimate the total landings in some instances. The figures are however thought to be broadly indicative of trends.

1 Overview of the UK Fishing Industry

1.1 The UK Fishing Industry

The fishing industry in the UK has around 7170 fishing vessels, with a further 559 vessels registered in the Channel Islands and the Isle of Man. In the year 2001 some 738 thousand tonnes of sea fish were landed into the UK and abroad by the UK fleet with a total value of £574 million. In addition the UK imported some £1432 million of fish. The UK also exported fish and fish products to the value of £700 million. The UK has a substantial fish processing industry of around 550 businesses which employ some 22 thousand people. At the retail level there were approximately 1.4 thousand fishmongers in the year 2000. 68.7 percent in volume and 67.0 percent in value, excluding canned produce is sold through supermarkets. Fish is also consumed in restaurants and in take away form, from fish and chip shops. A small proportion of the catch is used to make fish oils and animal feeds. Some of the species caught by UK fishing vessels find a better market abroad and these species are usually exported or landed directly abroad. In 2001, UK vessels landed directly into non-UK ports 280 thousand tonnes of sea fish with a value of £151 million.

1.2 Administration of the UK Fishing Industry

Fisheries Departments in the UK are comprised of the Department for Environment, Food, and Rural Affairs (DEFRA), the Scottish Executive Environment & Rural Affairs Department (SEERAD), the National Assembly for Wales Agriculture Department (NAWAD), and the Department of Agriculture and Rural Development for Northern Ireland (DARD). Departments in the Isle of Man, Jersey and Guernsey are responsible for administering fishing activity in their respective areas.

1.3 The Common Fisheries Policy

The primary aim of the Common Fisheries Policy (CFP) is to ensure rational and sustainable exploitation of fish stocks through conservation and management policies designed to protect resources and reflect the needs of the fishing industry. Structural policies are aimed at improving the balance between catching capacity and available resources by addressing fishing effort. Conservation policies are aimed at regulating the quantities of fish caught, through a system of Total Allowable Catches (TACs) based on scientific advice. These TACs are allocated as quotas to Member States in accordance with fixed keys based on historic fishing rights. They are complemented by a series of technical conservation measures intended to achieve more selective fishing, for example by setting rules on minimum landing sizes, minimum mesh sizes and gear design, as well as defining areas of seasonal closures, methods of fishing and target species. Opportunities to fish in third country waters are also secured through the CFP.

1.4 Producer Organisations

Producer Organisations (POs) are established under the CFP to enable groups of fishermen to market the fish they catch. In 1985 POs were given the opportunity to manage allocations of some whitefish stocks subject to TAC restrictions in the North Sea (Area IV) and West of

Scotland (Area VI). In 1991 this opportunity was extended to TAC whitefish stocks in the English Channel and Western waters (Area VII). Since 1995, POs wishing to manage quota allocations for whitefish stocks in Areas IV, VI and VII have been required to do so for all such stocks; a similar requirement for pelagic stocks was introduced in 1999. Allowing POs to take on this management responsibility enables them to plan their uptake of their particular allocations to optimise the benefit to their members. In 2001 there were 20 POs in the UK.

1.5 Sea Fisheries Committees

There are twelve Sea Fisheries Committees (SFCs) which regulate local sea fisheries around virtually the entire coast of England and Wales out to 6 miles. SFCs were established in the last century and are empowered to make bye-laws for the management and conservation of their districts' fisheries. In 1995 their powers were widened to include the control of fisheries in their districts for environmental reasons.

1.6 Statistics for Managing Fisheries

Prior to 1984, all UK catch statistics were provided to the Fisheries Departments on a voluntary basis. Since that year the regulations of the CFP have required those UK vessels which account for most of the fish caught to provide to the Sea Fisheries Inspectorates of the respective Fisheries Departments, located at the main ports, information on each trip including the main species caught, the area of capture, and the quantities landed. Additional information is collected to complete, as far as possible, the coverage of fishery activity. The combined data provide the main source of catch and landings statistics for UK vessels as recorded in the tables in this publication. (For further information regarding the statistical methodology see Appendix 2 of this publication).

The catch and landings statistics provide a system for monitoring the uptake of the UK share of stocks for which annual TACs are set. In any year once the quota has been taken the fishery is closed.

Information on the fishing fleet is obtained from the Register of Shipping and Seamen, part of the Maritime and Coast Guard Agency an executive agency of the Department for Transport.

Source:- Fisheries Departments in the UK, H.M. Customs and Excise, National Food Survey, Office for National Statistics

(a) GDP for fishing includes landings abroad.

(b) Year-on-year comparisons may be affected by changes in the industrial classification of some contributors. For most businesses data are appropriate to a single activity heading; where information covers a mixture of activities, the business is classified according to the main activity.

(c) The number of vessels excludes those registered in the Channel Islands and Isle of Man.

(d) The quantity of landed fish is expressed in terms of liveweight. The figures relate to landings both into the UK and abroad.

(e) Imports are valued at cost, including insurance and freight terms whereas exports are valued at free on board terms.

(f) The landed price index has been calculated on an annual basis with 1987 = 100

(g) The fish component of the RPI which includes canned and processed fish. The Index is calculated on a monthly basis with January 1987 = 100

2 The structure of the UK fishing industry

2.1 Introduction

Statistics on the UK fishing fleet since 1990 have been based on the fleet of fishing vessels as registered with the Register of Shipping and Seamen, part of the Maritime and Coast Guard Agency which is an executive agency of the Department for Transport. Information provided by the Registry includes the length (overall and registered), breadth, gross tonnage, power, age and material of construction. Information on the fishing fleets of the Isle of Man, Guernsey and Jersey are supplied by the respective registering authorities. Prior to 1990, the statistics were based on fishing vessels known by Departments to be active.

Statistics on the size of the UK fishing fleet are complicated by the fact that the European Union has been progressively altering the methodology used to determine vessel tonnage for the fishing fleet from various national and international standards, previously collectively called GRT, to a common standard based on the International Tonnage Convention 1969 (ITC '69) and known as GT. A phased programme of re-measurement has been introduced in the UK in 1996 and is due to be completed by end 2003.

Whilst vessel tonnage is a volumetric measure, there is no simple mathematical relationship between GRT and GT. For any given vessel, a GT figure can only be obtained by physical measurement or, in the case of smaller vessels, by the application of formulae provided by the EU designed to give an approximation. GT figures are often higher than GRT figures for the same vessel, the range of outcomes can be as low as 50 percent or as high as 300 percent of the original tonnage according to the individual vessel characteristics; for large vessels, GT is almost always higher than GRT.

Licensing of vessels first applied in 1977 and covered only fishing vessels over 40 feet (12.14 metres) in certain fisheries. Following the adoption of the European Union's Common Fisheries Policy, the UK designated a number of fish stocks as pressure stocks and introduced a restrictive licensing scheme for vessels fishing those stocks. The licensing regime initially only covered vessels over 10 metres registered length, but its coverage has been progressively extended over the years. In February 1990 the licensing regime was extended to vessels of over 10 metres overall length fishing for TAC stocks. Later the same year restrictive licensing was extended to cover all fishing by vessels over 10 metres overall length with the exception of those fishing for salmon and migratory trout which were covered by a separate regime. From May 1993 licensing was extended to vessels of 10 metres and under overall length.

For statistical purposes a fishing vessel is attributed to the port and the corresponding Department which issues its licence. In Tables 2.4 and 2.5, a number of vessels were unattributed to any Department; these include vessels which are currently registered but which do not presently hold a licence.

2.2 Fleet structure and Multi-Annual Guidance Programmes

The Multi-Annual Guidance Programmes of the CFP provides a framework for bringing fishing capacity into line with the available fish stocks. A new MAGP covering the years 1997-2001 was agreed in 1997. As before, each Member State's fleet is subdivided into segments. Capacity or effort reduction targets were set for each of these segments and these are tailored to the particular circumstances of each Member State's fleet. In the UK, these segments are based on the recorded activity of fishing vessels, with each vessel attributed to a segment on the basis of the fishing activity it undertakes most often.

Table 2.2a gives details of the number of vessels, tonnage and power of the UK fleet in total and by segment at end 2001. Table 2.2b, first introduced in 1998 edition, shows the evolution of the capacity of the UK fishing fleet since end 1992. The series for GT* (see appendix 1) is expressed in consistent terms from 1996 onwards, reflecting vessels which had re-measured to ITC '69 by end 2000.

2.3 Number of Fishermen

Statistics on the number of fishermen are drawn from surveys carried out by the Sea Fisheries Inspectorates in England, Wales and Northern Ireland and by the Sea Fisheries Protection Agency in Scotland. Overall, the number of fishermen continues to decrease.

- (a) Prior to 1952 figures were based on information supplied by the Registrar General of Shipping and Seamen. Since 1952 figures have been supplied by the District Fishery Officers of DEFRA.
- (b) From 1966 these figures exclude 'hobby' fishermen, i.e. fishermen who do not fish commercially. The corresponding figures for Scotland and Northern Ireland have never included 'hobby' fishermen.
- (c) Includes 1986 figures for Newlyn and Plymouth.
- (d) The apparent increase in fishermen in Scotland reflected the licensing of 10m & under vessels; when more information became available on the numbers of such active vessels.

3 Catches and Landings Data

3.1 Summary

In 2001, the UK fleet, including the Channel Islands and Isle of Man vessels, landed in the UK and abroad 738 thousand tonnes of sea fish (including shellfish) with a value of £574 million. Compared to 2000 landings, a 1 percent decrease in quantity, and a 4 percent increase in value were recorded.

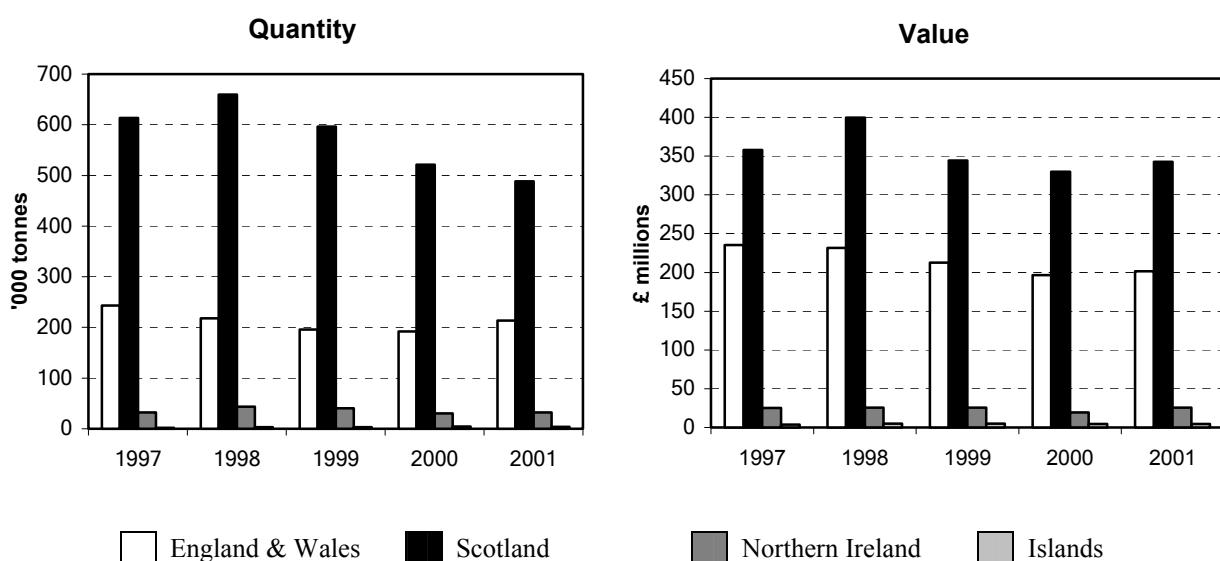

Some 62 percent of fish taken by the UK fleet were landed in the UK, the remainder being landed at ports abroad. In terms of value, 74 percent of landings by the UK fleet were into the UK.

Vessels with departments of administration in Scotland accounted for 66 percent of the weight and 60 percent of the total value of total landings by the UK fleet. English and Welsh vessels accounted for 29 percent of the quantity and 35 percent of the value of the total, whilst Northern Ireland vessels represented 4 percent by quantity and 4 percent by value. An alternative representation of landings by department of administration can be seen in Chart 3.1.

3.2 UK Landings

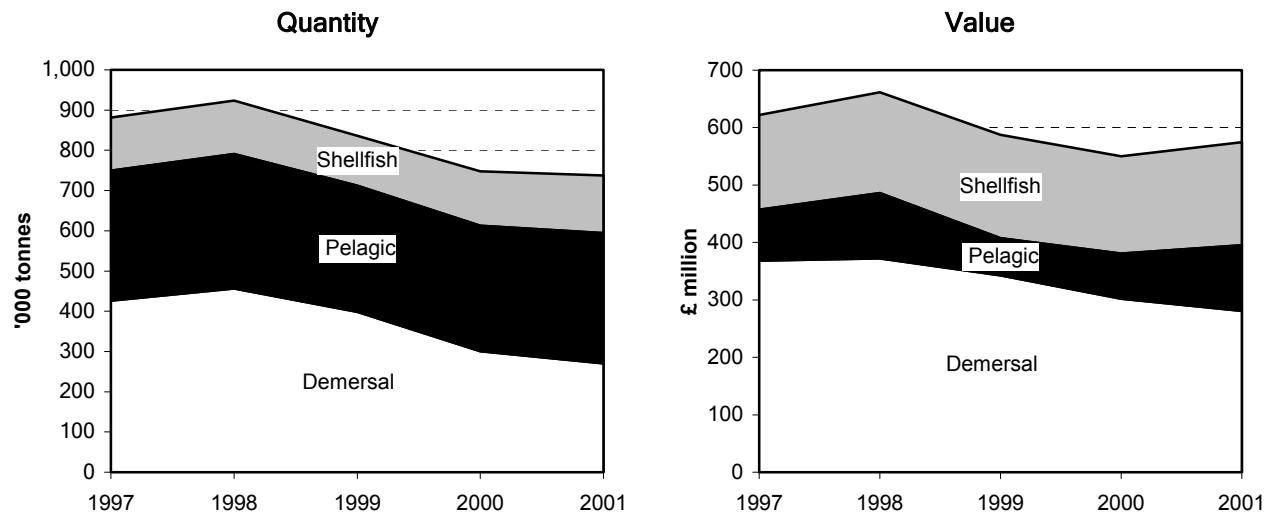

The total quantity of fish landed by the UK fleet into the UK has decreased steadily since 1997 and fell from 465 in 2000 to 458 thousand tonnes in 2001. Value remained constant at £423 million. Of landings into the UK by the UK fleet demersal species represented 43 percent of total landings by the UK fleet in terms of quantity and 52 percent in terms of value. Pelagic species accounted for 28 percent of landings by quantity but only 9 percent by value, and shellfish for 30 percent quantity and 39 percent value.

Chart 3.1 Quantity and Value of Landings by the UK Fleet into the UK and Abroad by Department of Administration 1997 - 2001

In 2001 demersal species represented 37 percent of total landings by the UK fleet in terms of quantity and 49 percent in terms of value. Pelagic species accounted for 44 percent of landings by quantity but only 20 percent by value, and shellfish for 19 percent quantity and 31 percent value. Further detail can be seen in Chart 3.2.

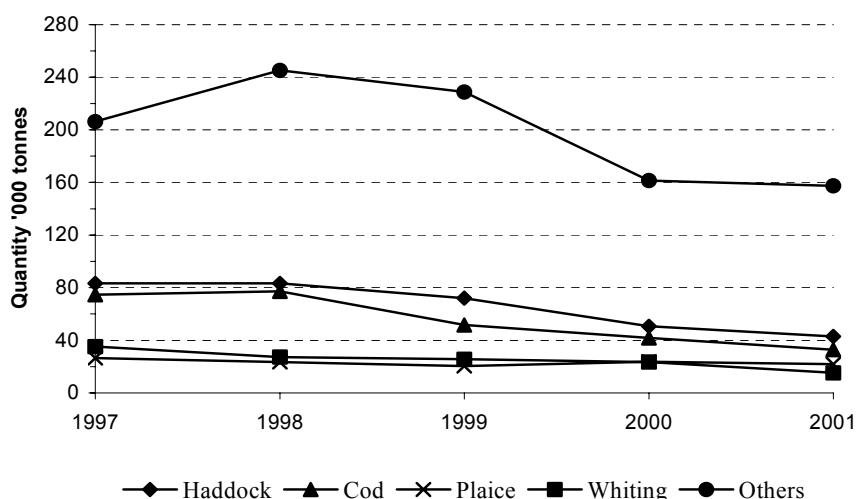

Chart 3.2 Landings by UK Vessels into the UK and Abroad

3.2.1 Demersal Fish

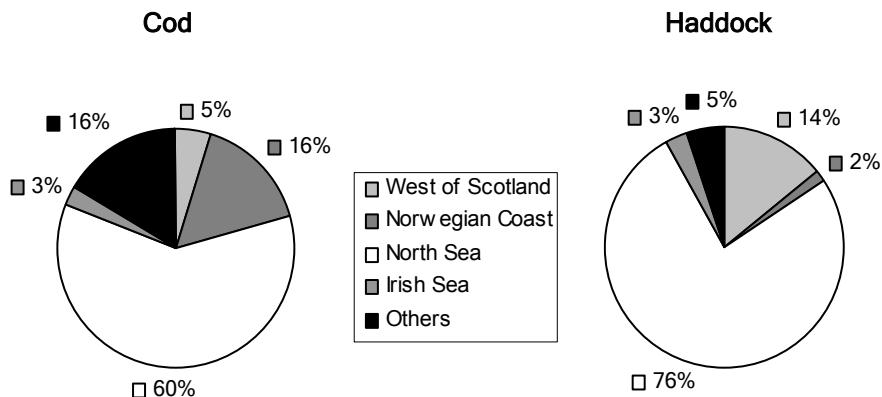

Haddock, cod, whiting and plaice accounted for 48 percent of the demersal species landed by UK vessels into the UK. As can be seen from Chart 3.3, landings of haddock and cod have generally decreased since 1997. Landings of whiting have also decrease markedly, as have total demersal species over the five year period. A more detailed species breakdown of demersal landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.3 Landings of Demersal Species by UK Fleet into the UK and Abroad

Of the 33 thousand tonnes of cod landed by the UK fleet into the UK and abroad in 2001, the largest proportion of 60 percent (19.7 thousand tonnes) were caught in the North Sea (Area IV), 16 percent (5.2 thousand tonnes) were caught off the Norwegian Coast (Area IIa), and 5 percent (1.7 thousand tonnes) were caught in the West of Scotland area (Area VIa). Catches in other areas accounted for 16 percent (5.4 thousand tonnes) of landings (see Chart 3.4).

Chart 3.4 Percentage of Cod and Haddock Landed by the UK Fleet by Sea Area of Capture 2001

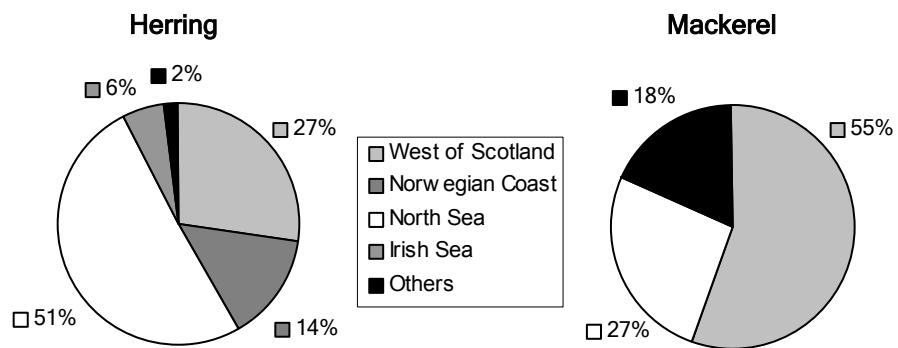

Of the 43 thousand tonnes of haddock landed by UK fleet in 2001, the largest proportion of 76 percent (33 thousand tonnes), were caught in the North Sea and 14 percent (6 thousand tonnes) were caught in the West of Scotland area (see Chart 3.4).

3.2.2 Pelagic Fish

Herring and mackerel are the two main pelagic species landed by UK vessels into the UK and abroad, accounting for 87 percent of the total pelagic landings. Landings of herring by the UK fleet have decreased since 1997. Landings of mackerel have increased since 1999 and are at a five year high of almost 200 thousand tonnes. The same two species are also the most important in terms of value. Annual landings of mackerel were valued at about £82 million and herring at £23 million. Values for both have risen markedly following a peak in 1998. A more detailed species breakdown of pelagic landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.5 Percentage of Herring and Mackerel Landed by the UK Fleet by Sea Area of Capture 2001

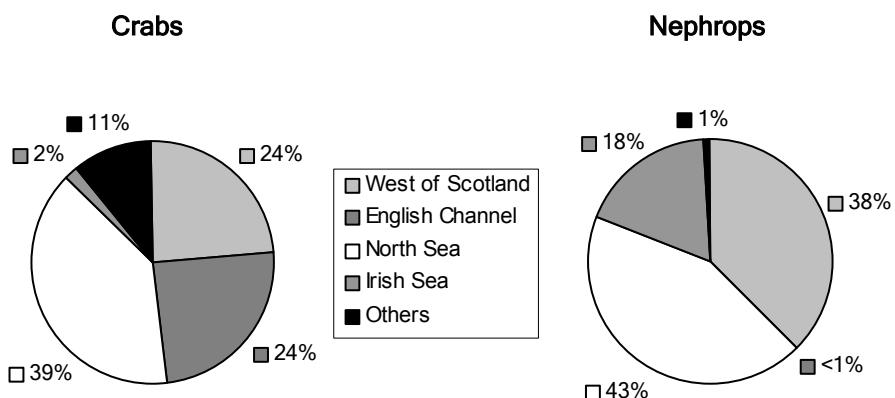

Of the 81 thousand tonnes of herring landed by the UK fleet in 2001, the largest proportion of 51 percent (41 thousand tonnes) were caught in the North Sea (Area IV), 27 percent (22 thousand tonnes) were caught in the West of Scotland (Area VIa), and 14 percent (12 thousand tonnes) were caught in the Norwegian Coast (Area IIa) (see Chart 3.5).

Of the 199 thousand tonnes of mackerel landed by UK fleet in 2001 into the UK and abroad, the largest proportion of 55 percent (109 thousand tonnes) were caught in the West of Scotland area (Area VIa) and 27 percent (53 thousand tonnes) in the North Sea (see Chart 3.5).

3.2.3 Shellfish

The two species of shellfish which account for the majority of shellfish landings by the UK fleet are crabs (19 percent) and nephrops (20 percent). Landings of crabs and nephrops have remained relatively stable over the past five years, and are important in terms of value accounting for some 56% of total shellfish value. Scallops were an important species in terms of value, accounting for 17 percent of the total shellfish value in 2001. A more detailed species breakdown of shellfish landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Chart 3.6 Percentage of Crabs and Nephrops Landed by the UK Fleet by Sea Area of Capture 2001

Of the 27 thousand tonnes of crab landed by the UK fleet into the UK and abroad in 2001, the largest proportion of 39 percent (11 thousand tonnes) were caught in the North Sea (Area IV), 24 percent (6.4 thousand tonnes) were caught in the English Channel (Area VIId,e) and a further 24 percent (6.5 thousand tonnes) were caught in the West of Scotland (Area VIa) (see Chart 3.6).

Of the 29 thousand tonnes of nephrops landed by UK fleet in 2001, 43 percent (12.4 thousand tonnes) were caught in the North Sea (Area IV), 38 percent (11 thousand tonnes) in the West of Scotland area and 18 percent (5.2 thousand tonnes) were caught in Irish Sea (Area VIIa) (see Chart 3.6).

4 Supplies, Overseas Trade and Marketing

This chapter brings together the information on the fish available for consumption, imports, exports, prices and household consumption. The landings data are given in terms of equivalent live weight. The trade data are shown in terms of actual product weight.

4.1 Partial Balance Sheet for the UK

Chart 4.1 shows a partial balance sheet for the UK. Details are given in Table 4.1 - separate tables are given for demersal, pelagic and shellfish, and within these groupings, for particular species. In aggregate terms, the UK has been a net importer of fish throughout the period 1991 - 2001.

Chart 4.1 International trade of fish

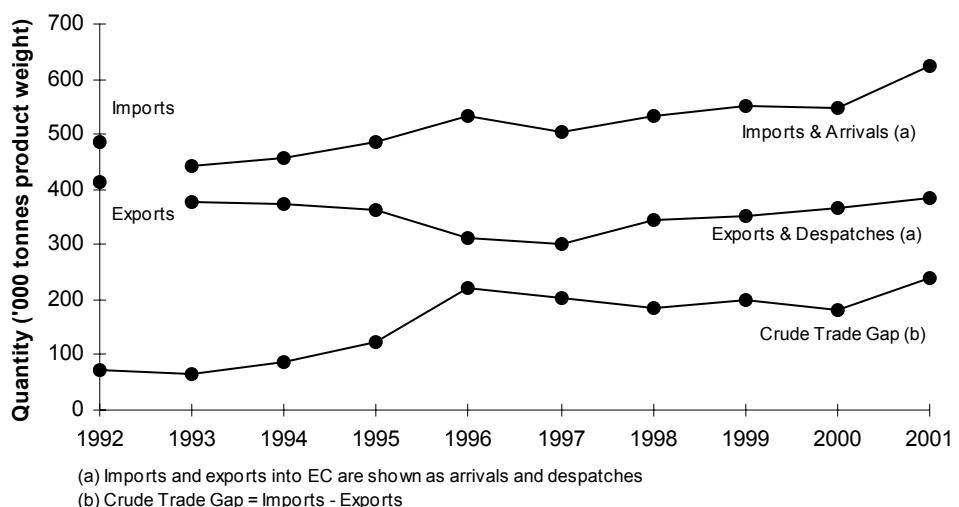

Chart 4.2 Quantity of fish available for domestic use in the UK

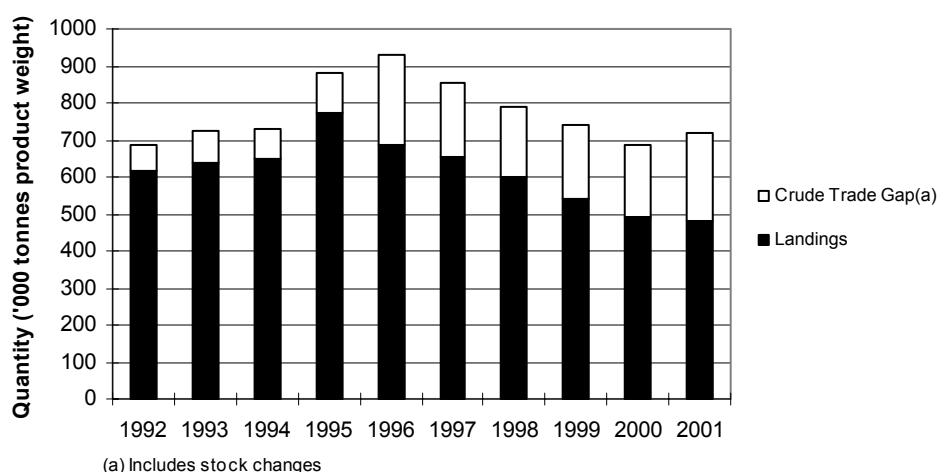

Chart 4.2 shows that landings by UK vessels into the UK increased and then fell over the last ten years with a peak in 1995 of 772 thousand

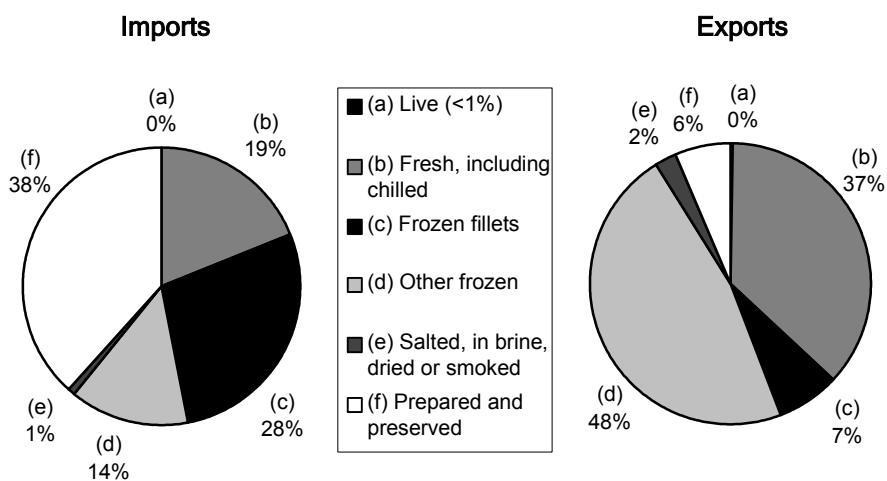

tonnes and a ten year low accounting for less than 500 thousand tonnes occurred in 2001. More detailed landings data can be found in Chapter 3. Adding the crude trade gap to the landings, and taking into account stock changes, gives us a figure for the total available for domestic (UK) use. This quantity was relatively constant between 1992 and 1994, with a small increase between 1994 and 1995, and an increase of around 100 percent between 1995 and 1996. Between 1996 and 2001 the Crude Trade Gap has been relatively constant, accounting for a larger proportion of quantity available for domestic use than between 1992 and 1994.

4.2 Imports

Total imports of fish and fish preparations have generally increased since 1993 from 442 thousand tonnes to in 1993 to just over 625 tonnes in 2001. In terms of value, total imports rose in 2000 to £1,325 million and to £1,432 million in 2001.

Demersal and pelagic fish and fish products accounted for approximately 84 percent of total imports by weight and approximately 71 percent of total imports by value in 2001. Prepared and preserved fish accounted for 38 percent of total demersal and pelagic fish and fish products imported into the UK by weight; frozen fillets for 28 percent; other frozen products for 14 percent and fresh, including chilled, for 19 percent. More detailed breakdown of both quantity and value of imports can be found at Table 4.2.

Chart 4.3 Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK in 2001

In 2001 the UK imported 201 thousand tonnes of prepared and preserved demersal and pelagic fish. Of this total, 100 thousand tonnes were tuna and bonito, and a further 41 thousand tonnes were salmon. The highest quantities of prepared and preserved demersal and pelagic fish were imported from the Seychelles, Mauritius, and Ghana. Further information on the country of origin of UK imports can be found in Table 4.4.

In 2001 the UK imported 17 thousand tonnes of fresh and chilled cod and 20 thousand tonnes of fresh and chilled haddock. In addition 82 thousand tonnes of frozen cod fillets and 20 thousand tonnes of other frozen cod were imported.

The main type of shellfish imported into the UK in 2001 was shrimps and prawns, of which 34 thousand tonnes were imported in the form of fresh, chilled, frozen or semi-preserved. The main type of prepared or preserved shellfish were also shrimps and prawns, with 45 thousand tonnes imported.

In total the UK imported 19 thousand tonnes of shellfish from Iceland, 9 thousand tonnes from both Norway and India, and 8 thousand tonnes from Denmark.

4.3 Exports

In 2001 total exports of fish and fish preparations increased by 5 percent to 385 thousand tonnes product weight. In terms of value, total exports also increased by 5 percent in 2001 to £732 million.

In 2001 demersal and pelagic fish and fish products accounted for approximately 75 percent of total exports by weight and approximately 59 percent of total exports by value. Fresh, including chilled fish, accounted for 37 percent of total demersal and pelagic fish and fish products exported from the UK by weight. Frozen fillets accounted for 7 percent, other frozen products for 48 percent and prepared and preserved products for 6 percent. A more detailed breakdown of both quantity and value of exports can be found at Table 4.3.

In 2001 the UK exported 106 thousand tonnes of fresh demersal and pelagic fish (including chilled). Of this total 49 thousand tonnes were salmon.

In 2001 the UK exported 95 thousand tonnes of shellfish and shellfish preparations. Of this total 33 thousand tonnes were to France and 21 thousand tonnes to Spain.

4.4 Prices

The average annual prices quoted in this publication are based on realisations for first-hand sales of fish to all outlets, i.e. for human consumption and for other uses such as fish meal and animal feeding stuffs. These prices are calculated using the equivalent live weight.

In 2001 the average annual price of fish was £924 per tonne with the total demersal price, compared to that of 2000 increasing by 2 percent to £1,117 per tonne; the price of pelagic fish increasing by 38 percent to £300 per tonne; and the total shellfish price increasing by 2 percent to £1,229 per tonne. A more detailed breakdown of these prices for individual species for selected years can be found at Table 4.10.

- (a) Salmon and trout are excluded from the landings data.
- (b) Landings are given in terms of landed weight equivalent (i.e. head on, gutted for most species).
- (c) Landings include transhipments of mackerel.
- (d) Data on both imports and exports are provisional in 1993 and 1994. They appear to be incomplete by an unknown margin.
- (e) Total Available for Domestic Use = Total Supplies - Exports - Stock Changes.
- (f) The processing figures are supplied by FAO.
- (g) The fish component of the RPI. The Index is calculated on a monthly basis with January 1987 = 100.

(a) Data on imports are provisional. They appear to be incomplete by an unknown margin

(b) Fillets are expressed in terms of product weight.

(c) Includes pelagic fish other than herring, which are not separately identifiable.

(d) Large amounts of salmon and trout are imported as prepared and preserved fish (See Table 4.2)

- (a) Data for the years 1938 to 1987 were originally calculated on a standard landed weight basis. These data have been converted to a liveweight basis for comparison purposes; however they should not be regarded as showing the accurate liveweight price but may be used to indicate trends
- (b) Average values for the UK not available. Landings in Scotland of the species in the years indicated were included with "Other Demersal" or "Other Shellfish".
- (c) Prior to 1972 landings of Scallops and Queens were not separately identifiable and were entered under one heading of Scallops.

5 Main Stocks and Their Level of Exploitation

By Dr Colin Bannister, Senior Fisheries Advisor at CEFAS

5.1 The management of stocks

Fisheries are managed using a Total Allowable Catch or TAC (corresponding to a particular harvesting rate), and technical measures (mainly mesh sizes and minimum landing sizes, which determine the smallest fish that can be caught and landed). The TAC is set each year by the EU Council of Ministers following negotiations on catch options that are provided by the Advisory Committee on Fishery Management (ACFM) of the International Council for the Exploration of the Sea (ICES), an independent scientific body. For the main North Sea stocks these options take into account the terms of a management agreement between the EU and Norway. Once a TAC is agreed for each stock and fishing area it is allocated as quotas to member states in accordance with keys based on historic track records.

5.2 Scientific assessment and advice

ICES advice is based on stock assessments carried out at international working groups, where fishery scientists from the UK and the other exploiting nations compile data on fishery landings, fishing effort, the biology and age structure of the stock, and the results of stock surveys. The age structure of the stock contributes to an estimate of the harvest rate. This is then combined with the landings, effort and survey data to estimate the current abundance of the stock, and the historical trend. The assessment then makes a forecast of the likely upcoming catch for a range of fishing rate options. The forecast takes into account the number of young fish that are expected to enter the stock, based on survey data, or a recent historical average. Since 1999 the advice has identified the catch options that meet precautionary criteria. These criteria aim to ensure the sustainability of stocks by keeping spawning biomass above a minimum precautionary level, and the harvest rate below a maximum precautionary level.

Scientists describe the state of the stocks in terms of the spawning stock biomass (SSB, the weight of mature fish), the fishing rate, and the number of juvenile fish or recruits in each year-class (see Appendix 1 for definitions of these terms). The following section summarises the current state of the main stocks based on the most recent ACFM Report (ICES Cooperative Research Report No 246. Report of the ICES Advisory Committee on Fishery Management, 2001. Parts 1, 2 and 3.). This report is the outcome of the ACFM meetings of May and October 2001, which evaluated stock assessments based on fisheries data for years up to and including 2000, and survey data up to and including 2001. The resulting advice formed the basis for the 2002 TACs.

5.3 The State of the Main Stocks

5.3.1 North Sea roundfish

The main North Sea roundfish stocks are those for cod, haddock, whiting and saithe, whose landings have all declined since their high point in the 1970s and 1980s.

5.3.2 North Sea flatfish

The main stocks are the plaice and the sole. Plaice landings and SSB fell steeply from 1990 to 1997 as fishing rate increased, but in the last three years the fishing rate has fallen somewhat, and SSB has increased from the 1997 low point. The advice is to constrain the fishing rate in order to maintain this recovery. In the case of sole, the fishing rate has been fluctuating at a high level, but periodic good year-classes have prevented the stock from falling persistently below the precautionary level. The advice is to reduce the fishing rate in order to prevent the stock from deteriorating.

5.3.3 North Sea herring and mackerel

In the mid-1970s the North Sea herring fishery collapsed and was closed for several years. The stock then recovered to a peak in 1990, fell back in the mid-1990s, and is now above the precautionary level following the advent of several recent good year-classes. The state of the herring stock is therefore reasonably optimistic. Current advice restricts the fishing rate on both juvenile and adult herring under the terms of the Norway-EU agreement. The North Sea mackerel stock has still not yet recovered from the collapse of the 1970s, and the fishery remains closed.

5.3.4 English Channel flatfish

Sole stocks in the eastern and western Channel are discrete stocks that are assessed and managed separately. In the eastern Channel (the larger of the two stocks), the fishing rate has been decreasing recently, and the SSB increasing, and the advice is to keep the fishing rate below the precautionary level. In the smaller western Channel stock, the fishing rate has fluctuated at a moderate level, but SSB has been declining for a number of years. The advice is to reduce the fishing rate below the

precautionary level. The plaice stock in the eastern Channel is linked to that in the southern North Sea but is separate from that in the western Channel. In the eastern Channel, the fishing rate on plaice is high, but SSB is above the precautionary level, and the advice is to maintain this by reducing the fishing rate to the precautionary level. In the western Channel the fishing rate on plaice is also high, and SSB, although stable, is below the precautionary level. The advice is to constrain the fishing rate on both stocks below the precautionary level.

5.3.5 Westerly anglerfish and megrim

There are two anglerfish species, whose landings are fluctuating without trend, and whose stocks are fluctuating above and below the precautionary level. The advice is to maintain the fishing rate below the precautionary level. The megrim stock has fluctuated above the precautionary level since 1990, and landings are stable. The advice is to constrain the fishing rate at the precautionary level.

5.3.6 Hake

Hake is assessed as a single stock throughout its range along the western seaboard. The assessed fishing rate, although less than that on cod and haddock stocks, is above the precautionary level, and there is too much fishing on small fish. SSB has been declining steadily since the 1980s, and is now well below the precautionary level. Fishery landings and the number of young hake have been declining since 1990. The EU has developed a rebuilding plan to cut the TAC, and to reduce the capture of juvenile fish by increasing mesh sizes and restricting fishing in critical nursery areas.

5.3.7 Western Mackerel

Mackerel is assessed as a single stock throughout its range from the North Sea to the Western Approaches. In the western and southern areas the fishing rate is moderate, landings have been stable, and SSB has increased during the 1990s. The advice is to maintain fishing on the southern and western components at the precautionary level. In the North Sea, however, where the stock is very low, directed fishing is not permitted.

5.3.8 Irish Sea roundfish

The cod and whiting stocks in the Irish Sea are seriously depleted, and landings have fallen since the 1980s. There is concern about stock collapse because the fishing rate is very high, spawning stocks have fallen well below the precautionary level, and the abundance of young cod and whiting has declined since 1990. The EU has significantly reduced the cod and whiting TACs, and has implemented other measures for cod, including a seasonal spawning ground closure in the western Irish Sea, and increases in mesh size. In the relatively new fishery for haddock, landings peaked in 1998, and the stock is declining. The advice is to constrain the fishing rate within the precautionary level.

5.3.9 Irish Sea flatfish

The fishing rate on Irish Sea plaice and sole has been declining over the last few years, and although the abundance of young plaice has been below average in the 1990s, SSB in both stocks is currently above the precautionary level. The advice is to set TACs that constrain the fishing rate below the precautionary level.

5.3.10 West of Scotland roundfish

The cod, haddock and whiting stocks west of Scotland are heavily fished. The SSB is seriously depleted in both cod and whiting, and the abundance of young cod and whiting has also declined since 1990, so that the fishery is not sustainable. In 2001 the EU cut the cod and whiting TACs significantly, and developed a cod rebuilding plan involving closed areas and an increase in mesh size. The haddock advice is to constrain fishing rate within the precautionary level.

- (b) Over the period 1963-2001.
- (c) The region of capture also includes Skaggerak and Kattegat (IIIa).
- (d) The region of capture also includes Eastern English Channel.
- (e) Over the period 1960-2001.
- (f) Over the period 1957-2001.
- (g) Over the period 1968-2001.
- (h) Over the period 1970-2001.
- (i) Over the period 1966-2001.
- (j) Over the period 1965-2001.
- (k) Over the period 1972-2001.
- (l) Over the period 1974-2001.
- (m) Forward projection.
- (n) Estimated from surveys or average assumed.

6 Overview of the Fishing Industry in Europe

6.1 The European Fishing Fleet

Table 6.1 shows the composition of the European Union fishing fleet as at 31 December 2001 as provided by Eurostat.

There were just under 92,500 vessels in the EU fleet at the end of 2001, a decrease of 2.8 percent since the end of 2000. As in 2000 Greece, Italy and Spain have the largest total fleets, with some 56 percent of the EU fleet. The UK fleet made up 8 percent of the total. For vessels over 12m of length Italy and Spain have the largest fleets making up fifty percent of the EU fleet.

Chart 6.1 European fleet by nationality of vessel, as at 31 December 2001

6.2 Fleet EU Quotas and Uptake

Table 6.2 shows the 2001 European Union TACs and quotas (after exchanges etc), together with the uptake by each Member State. Member States are required to report to the European Commission details of landings into the Member State by their own vessels and those of other Member States. The figures may therefore differ from those for the UK reported in Chapter 3, which are based solely on the UK's report to the European Commission.

7 Overview of the World Fishing Industry

7.1 World Catch

The world catch data (Tables 7.1 and 7.2) presented in this chapter have been extracted from the most recently available data from the FAO. These tables present the annual statistics, for six years ending in 2000, on a world-wide basis, of nominal catches (See Appendix 1, Glossary of terms).

During the period of 1998 to 2000 the world catch figures from marine fishing areas increased from 79 million tonnes to 86 million tonnes in 2000, a level similar to that in 1996.

In 2000 China caught the largest volume of fish, 14.8 million tonnes. Peru had the second largest annual catch at 10.6 million tonnes. Japan, Chile and the USA all caught just under 5 million tonnes.

62 percent of the 86 million tonnes of fish caught in 2000 were caught in the Pacific Ocean. 28 percent were caught in the Atlantic and 10 percent in the Indian Ocean.

Marine catches from the Pacific ocean have shown a long term gradual increase, with 2000 catch figures up 2 percent on 1999.

In the Atlantic the catch has risen slightly since 1999, with the 2000 catch being 1 percent larger. In the Atlantic ocean, marine catches have tended to fluctuate between a low of 22 million tonnes (1991) and a high of 27 million tonnes (1976). In the Indian Ocean, marine catches have been gradually increasing, from 7.8 million tonnes in 1995 to 8.6 million tonnes in 2000.

Appendix 1: Glossary of terms

Demersal	The term demersal fish covers species living on or near the sea bed.
Exports	Exports consist of the outward movement of goods produced by businesses in the UK, plus goods, which after importation, move outward from bonded warehouses or free zones without having been transformed i.e. both exports and re-exports. Export statistics exclude fish caught by domestic fishing craft, whether or not processed on board, landed in foreign ports.
Fishing areas	Fishing areas are defined by international convention. The immediate waters around the UK are subdivided into ICES Sub-areas IV (North Sea), VI (West of Scotland) and VII, and its divisions (Western Approaches, VIIg,h; the Irish Sea, VIIa; and the Channel, VIId,e).
Fishing capacity	Fishing capacity is the physical dimension of fishing vessels measured in tonnage, kW or VCU.
Fishing effort	Fishing effort is a measure of the fishing activity of vessels based on fishing capacity and the time spent fishing. It may be expressed in tonnage days, kW days etc.
Fishing mortality	Fishing mortality is the proportion off a stock killed/dying each year as a result of fishing activity.
Fixed gears	Fixed gears are mainly used for demersal species. They are normally vertically hung curtains of netting which enmesh or entangle the fish, fixed to the seabed with anchors or weights and held upright with floats.
GRT	GRT (Gross Registered Tonnage) is a general term applied to a range of volumetric measures of vessel capacity.
GT	GT (Gross Tonnage) is a volumetric measurement of vessel capacity under the rules of the ITC69 (International Tonnage Convention).
GT*	GT* is a transitional, hybrid measure of fleet tonnage. It comprises actual gross tonnage for those vessels measured to ITC69, estimated gross tonnage (using formulae provided by the European Commission) for vessels less than 27m overall length no measured to GT, and GRT for any vessels of 27m or more overall length which have not yet been remeasured to GT. This measure will cease being transitional when all vessels over 15m overall length have had their gross tonnage measured to ITC69.
Imports	Imports consist of all goods moving into a country, including goods for domestic consumption and goods into bonded warehouses or free zones.

In accordance with the internationally recommended practice, import statistics include fish caught by foreign fishing craft, whether or not processed on board, landed in domestic ports.

Nominal catches

Nominal Catches consist of fish, crustaceans, molluscs and other aquatic animals, taken for all purposes (commercial, industrial and subsistence) except recreational, operating in inshore, offshore and highseas fishing areas (marine fishing areas). Inland waters, both fresh and brackish, are excluded. In view of the difficulty of distinguishing in many cases between recreational and subsistence fishing, figures may include recreational catches. Nominal catches refer to the landings converted to a live weight basis. There are many instances where the catches on board fishing vessels or factory ships are gutted, filleted, salted, dried, etc., or reduced to meals, oil, etc. The data on the landings of such species and products require conversion by accurate yield rates (conversion factors) to establish the live weight equivalents at their time of capture.

Pelagic

The term pelagic fish covers species found mainly in shoals in midwater or near the surface of the sea.

Purse seining

Purse seining is a method used exclusively for pelagic operations. A very large, deep net is shot around a fish shoal and is then closed, or pursed, at the bottom to trap the fish. The net is then hauled upwards to concentrate the fish near the surface, and the fish are taken on board using a separate lifting net or pump.

Recruits

Recruits are the young fish in the year class which is entering the fishery.

Seining

Seining is a method used exclusively for demersal fishing. The net, lighter than for trawling, is set on very long ropes designed to herd or contain the fish for capture in the net. After the fish have been surrounded by the ropes, the net is slowly hauled back to the vessel.

Shellfish

The term shellfish covers all crustaceans and molluscs.

Spawning stock biomass (SSB)

The spawning stock biomass (SSB) is the total weight of a species population capable of reproducing.

Stock

A stock is that part of a species population exploited in a defined fishing area.

Trawling

Trawling may be used either for bottom-dwelling (demersal) or mid-water (pelagic) species, the net being of a basic funnel-shaped construction and towed behind a vessel or between two vessels (pair trawling).

VCU

VCU (Vessels Capacity Unit) is calculated as follows : the overall length of the vessel in metres is multiplied by the breadth of the vessel in metres. This figure is then added to, the power of the engine in kilowatts multiplied by 0.45.

Year class

A year class is the young of any one annual spawning.

Appendix 2: UK Fisheries Statistics Methodology

Organisation of the National System of Fisheries Statistics

Fisheries data are mostly collected by officers in the Sea Fisheries Inspectorates and processed by officials of the various Fisheries Departments in the UK, namely the Department for Environment Food and Rural Affairs (DEFRA) (for England and Wales), the Scottish Executive Environment and Rural Affairs Department (SEERAD) and the Department of Agriculture and Rural Affairs for Northern Ireland (DARD) and Departments in Jersey, Guernsey and the Isle of Man.

The main legislation used is:

- (i) the EU fisheries legislation on keeping and submitting logbooks and providing landing declarations - Council Regulation (EEC) No. 2847/93 (as amended) and Commission Regulation (EC) No 2807/83 (as amended).
- (ii) general powers under the Sea Fisheries (Conservation) Act 1967 under which Ministers granting a licence can require the master, owner or charterer of the vessel named in the licence to provide him with such statistical information as he may direct. These powers were widened in the Sea Fish (Conservation) Act 1992 to cover other types of information and the form in which it is to be supplied.

DEFRA collates the information compiled by Fisheries Departments in the UK for this publication.

Method of Collecting, Processing and Compiling the Data on Catches, Landings and Average Prices

Sources of data - The sources include logbooks, landing declarations, sales notes and personal contact with fishermen and merchants. Port harbour masters also provide details of individual vessels landing at main coastal locations. The method used for collecting data depends upon the size of vessel and location of landings. Legislation covers the supply of data on logsheets for all vessels over 10m overall length in respect of catches of all species. Much information on the value of catches is provided by the industry. For vessels under 10 metres overall length, there is no statutory requirement under either EU or national legislation for fishermen to declare their catches. Information for this sector has been collected with the co-operation of the industry: it comprises log sheets and landing declarations voluntarily supplied by fishermen and assessments of landings derived from market sources and by correspondents located in the ports.

Full documentation is not required for most fishing for non-TAC species, including shellfish, and summary records are compiled using information supplied voluntarily by the industry, from a variety of local sources and surveys run by local Sea Fisheries Committees.

Landings abroad - UK vessels which land at foreign ports are required under EU legislation to dispatch copies of log sheets and landing declarations covering their trips to the vessels' home ports within 48 hours of landing. When these data are received at the home port, they are entered on the systems used for UK landings.

Attribution of area of capture - Details of the areas fished are taken from the logbooks and codes for the ICES divisions and statistical rectangles are keyed into the port micro-computers. Where a statistical rectangle is split into different areas (e.g. part is in EU waters and part in the Norwegian waters) an additional code is used to indicate the zone fished. The detailed codes are available on the central computer records. Where a vessel fishes in more than one area in a single trip, the total amounts for the trip of each species, as given in the sales notes and landing declarations are allocated to the areas in proportion to the estimated quantities of the species taken from each area, as recorded in the logbook. For the few landings from distant waters, the coding of the areas is less detailed but sufficient to identify the quota concerned.

Value of landings and average price data - Sales note information has been routinely provided for landings into Scotland. For landings into England, Wales and Northern Ireland much information is supplied by fishermen, though the amount of detail provided on grade and freshness is less complete. Average prices are derived using the presentation codes of the landings and the average values and quantities landed.

Data capture and processing - The Sea Fisheries Inspectorate at port offices carry out manual checks on the information provided. These include a check between logbook information and that given in the sales notes or observed as landed. Information from log sheets, landing declarations and other sources are then keyed into micro-computers connected to the main databases by government staff at port offices. In England and Wales new data entry facilities were introduced in late 1993 enabling details from the daily log sheet to be keyed though catch records may be summarised where these cover fishing over several days with the same gear and in the same rectangle. The catch data are used to apportion information from the landing declaration/sales note which is keyed separately. The fishing records are transmitted to the central computer systems where further checks are carried out on the data before they are reflected on the main landings databases.

Catch and landings statistics for the UK are compiled from the systems run by DEFRA and SEERAD. The former holds information on all landings into England, Wales and Northern Ireland by UK vessels and of landings abroad by vessels administered by DEFRA and DARD whilst the latter provides figures for landings into Scotland by all UK vessels and landings abroad by SEERAD administered vessels.

The Reliability and Completeness of the Data

Completeness - The collection system for all vessels over 10m attempts a complete coverage of all main fishing activity. Assessments based on local knowledge are used to estimate uptake of some fishing activity by vessels under 10 metres and for some shellfishing: proposals to move to a structured sampling system to estimate landings by the under 10 metre fleet are being considered.

Reliability - The reliability of the statistics is dependant upon the veracity of the documentation provided by fishermen. There are systems of surveillance using sightings by aircraft and by fisheries protection vessels and by satellite monitoring. This information is employed in checking the data.

Appendix 3: Further Information

Other useful official publications on sea fisheries statistics are:-

DEFRA publications

The English, Welsh and Northern Irish Fishing Vessel List as at 30 June 2001, available at www.defra.gov.uk/fish/industry.htm

The Monthly Return for England and Wales - Provides an up-to-date picture of landings into England and Wales

Statistics of Fish Landings in England, Wales and Northern Ireland by Port

Available from DEFRA, 17 Smith Square, Nobel House, Room 434, London, SW1P 3JR. Tel: 020 7238 5913, fsu@fish.defra.gsi.gov.uk

SEERAD publication

Scottish Sea Fisheries Statistics 2000 (ISBN 0-7559-0209-2)

Available from The Stationery Office, 71 Lothian Road, Edinburgh, EH3 9AZ. Tel: 0870 606 5566

DARDNI publication

Report on the sea and inland fisheries of Northern Ireland

Available from DARDNI Fisheries division, Tel: 02890 522373

FAO

FAO Yearbook: Fishery Statistics 200 - Capture Production, Vol. 90/1, (ISBN 92-5-0044769X)

FAO Yearbook: Production Yearbook 2000, Vol. 54, (ISBN 92-5-004666-9)

Available from The Stationery Office, 51 Nine Elms Lane, London, SW8 5DR. Tel: 020 7873 8787

Eurostat

Fisheries Yearbook 2001, ISBN (92-894-1748X)

Available from The Stationery Office, 51 Nine Elms Lane, London, SW8 5DR. Tel: 020 7873 8787
