## List of tables

Table		Page
1.1	Landings by UK vessels into major ports: 2006	5
1.2	Summary of UK fishing industry: 1997 to 2006	9
2.1	UK fishing vessels by Department of Administration: 1997 to 2006	14
2.2a	Main activity of the UK fishing fleet, by segment: 2005 to 2006	15
2.2b	The size of the UK fishing fleet: 1997 to 2006	15
2.3	UK over 10m fleet by licensing district: 2004 to 2006	16
2.4	UK fleet by vessel length: 2006	17
2.5a	Age of UK vessels (over 10m): 2006	20
2.5b	Age of UK vessels (10m and under): 2006	24
2.6	Fish Producer Organisation (FPO) membership: 2005 to 2006	28
2.7	Number of fishermen: 1938 to 2006	29
2.8	Number of fishermen by district: 2005 to 2006	30
3.1a	Landings into the UK and abroad by UK vessels: 2002 to 2006	38
3.1b	Percentage of landings into the UK and abroad by UK vessels: 2002 to 2006	39
3.2	Landings into the UK by UK and foreign vessels: 1938 to 2006	40
3.3	Landings into the UK and abroad by UK and foreign vessels: 2002 to 2006	41
3.4a	Landings into major ports in England and Wales by UK vessels: 2006	49
3.4b	Landings into major ports in Scotland by UK vessels: 2006	55
3.5	Landings into UK ports by UK vessels: 2002 to 2006	58
3.6	Landings into the UK by foreign vessels: 2006	62
3.7	Landings abroad by UK vessels: 2006	65
3.8	Landings into the UK and abroad by UK vessels by area of capture: 2006	68
3.9	Landings into the UK by UK vessels – by month of landing: 2006	73
4.1	Balance Sheet for the UK: 1997 to 2006	78
4.2	Imports of fish and fish preparations into the UK: 2005 to 2006	82
4.3	Exports of fish and fish preparations from the UK: 2005 to 2006	85
4.4	Imports of fish and fish preparations into the UK by exporting country: 2005 to 2006	88
4.5	Exports of fish and fish preparations from the UK by importing country: 2005 to 2006	94
4.6	Imports of fish products into the UK: 2005 to 2006	100
4.7	Exports of fish products from the UK: 2005 to 2006	102
4.8	Household purchases in the UK: 2000 to 2006	104
4.9	Household purchases in the UK: 1950 to 1990	104
4.10	Average annual prices of fish: 1938 to 2006	105
5.1	Main stocks and their status: 2002 to 2006	113
5.2	Spawning stock biomass and recruitment by stock over the period for which the assessments are available: 1946 to 2005	115
6.1	European Union fishing fleet by vessel length: 31 December 2006	124
6.2	Total Allowable Catches, quotas and uptake (%): 2006	126
7.1	World catch by nationality of vessel: 2000 to 2005	147
7.2	World catch by sea area: 1999 to 2005	150

3.3	Demersal landings into the UK and abroad by UK vessels: 2002 to 2006	33
3.4	Percentage of cod and haddock landed by UK vessels by area of capture: 2006	33
3.5	Percentage of mackerel and herring landed by UK vessels by area of capture: 2006	34
3.6	Percentage of crabs and nephrops landed by UK vessels by area of capture: 2006	35
3.7	ICES fishing areas around the UK coastline	36
4.1	International trade of fish: 1997 to 2006	75
4.2	Total fish available for domestic use in the UK: 1997 to 2006	75
4.3	Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK: 2006	76
6.1	European fleet by nationality of vessel: 31 December 2006	123
7.1	Major FAO fishing areas	146

## Preface

The UK Sea Fisheries Statistics are intended to provide a broad picture of the UK fishing industry and its operations. A note on the methodology used in this publication appears in Appendix 2. The content of this publication is also available on the MFA website [www.mfa.gov.uk](http://www.mfa.gov.uk).

We recommend that you refer to the explanatory notes and glossary of terms which are important in interpreting some of the data.

If you have any comments on this publication or would like more detailed information, please contact:

Email: [fsu@mfa.gsi.gov.uk](mailto:fsu@mfa.gsi.gov.uk)

## **Explanatory notes**

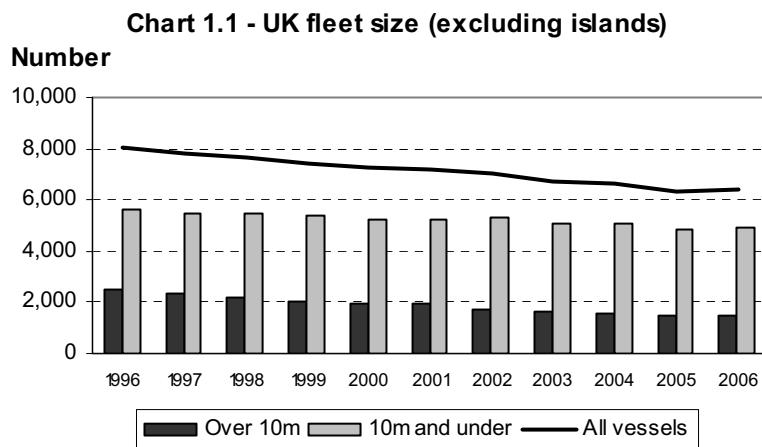

1. The tables refer, as far as possible, to the United Kingdom, including the Isle of Man and the Channel Islands, with separate figures for England and Wales, Scotland and Northern Ireland. In some cases figures for the various parts of the United Kingdom are not strictly comparable and differences are explained in the headings and footnotes of the tables.
2. The figures in the tables in Chapter 3 and 4 for catches and landings are given in terms of live weight.
3. Landings by foreign vessels into the UK include landings by fishing vessels and carriers (if first point of sale of fish). Total imports which combine landings by fishing vessels, carriers and cargo vessels are shown in Tables 4.2, 4.4 and 4.6.
4. Landing figures include a quantity caught by British vessels but not actually landed at British ports. These quantities are transhipped to foreign vessels in coastal waters and are later recorded as exports.
5. The following symbols apply throughout:
  - means "nil"
  - .. means "negligible" (less than half the last digit shown)
  - nd means "no data available"
  - na means "not applicable"
6. Difficulties in collecting complete statistics on shellfish landings mean that available figures may significantly underestimate the total landings in some instances. The figures are however thought to be broadly indicative of trends.

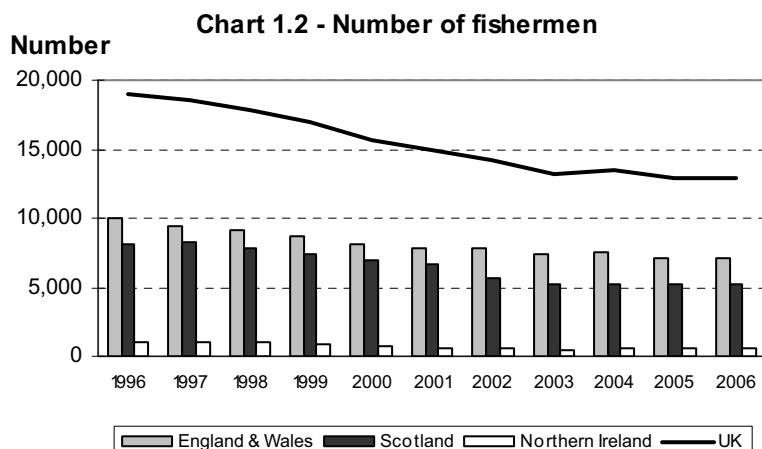

# 1 Overview of the UK fishing industry

## 1.1 Fleet size and employment

In 2006, the UK fishing industry had 6,372 fishing vessels compared with 8,073 in 1996, a reduction of 21 per cent. The fleet comprised 4,896 10 metre and under vessels and 1,476 over 10 metre vessels, down 13 per cent and 40 per cent respectively over the last 10 years. A further 386 vessels are registered in the Channel Islands and the Isle of Man.

There were 12,934 fishermen in 2006. This is down 32 per cent since 1996 although there has been little change in recent years. Of these, 7,116 were based in England and Wales (down 29 per cent in 10 years), 5,205 in Scotland (down 36 per cent) and 613 in Northern Ireland (down 36 per cent). Part-time fishermen accounted for 20 per cent of the total, a proportion that has changed little over the last 10 years. Further details can be found in Chapter 2.

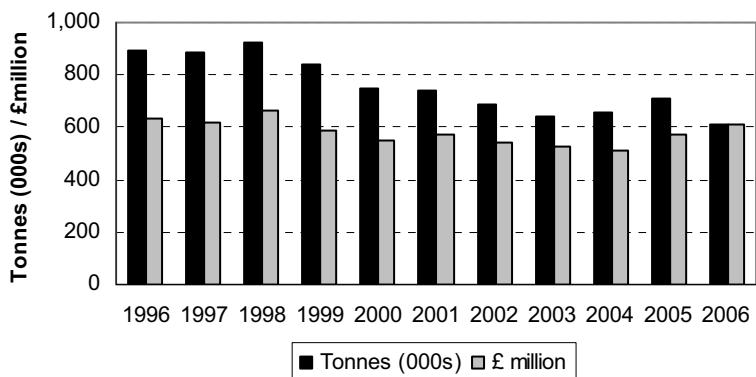

## 1.2 Catch by UK vessels

Chapter 3 presents information on quantity (live weight), value and area of capture for all UK vessels landing into the UK and abroad as well as foreign vessels landing into the UK.

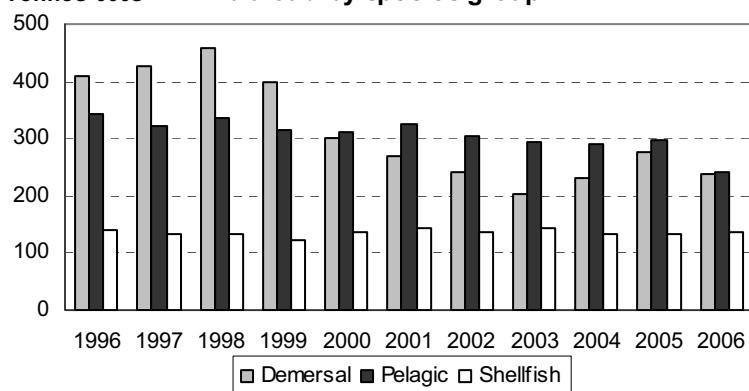

UK vessels landed 614 thousand tonnes of sea fish (including shellfish) in 2006, with a value of £610 million. Compared with 2005, this is a fall of 13 per cent in quantity but an increase of 7 per cent in value.

**Chart 1.3 - UK vessels landing into the UK and abroad**

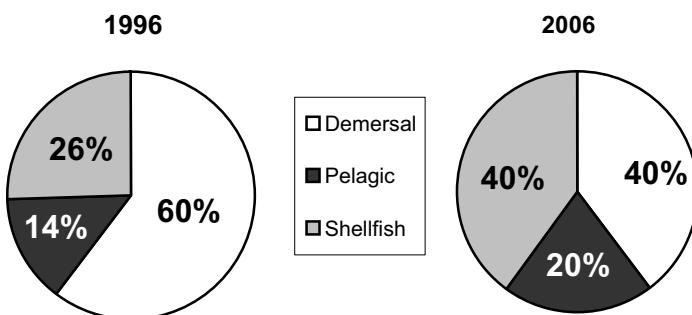

The reduction in the amount of fish landed is a result of a fall in the catch of demersal fish (down 15 per cent on 2005) and pelagic fish (down 20 per cent). Landings of shellfish rose by 4 per cent in 2006. The demersal catch has seen the largest decrease in recent years and has almost halved since 1998.

**Chart 1.4 - UK vessels landing into the UK and abroad by species group**

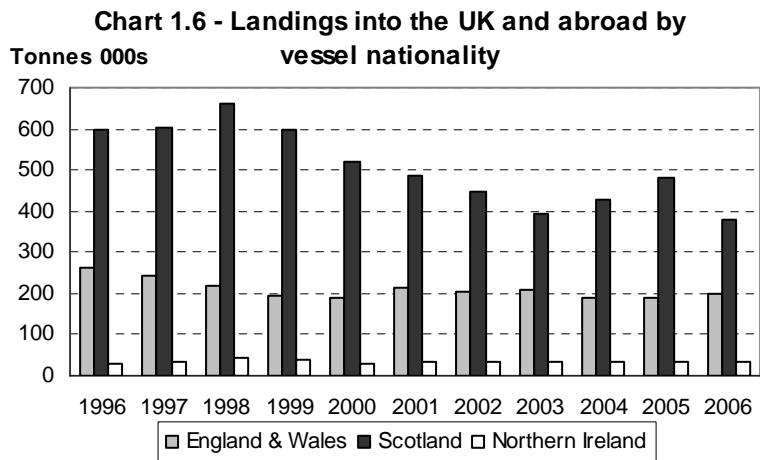

The reduction in landings of demersal and pelagic fish over the last 10 years has contributed to shellfish - which previously accounted for 26 per cent in value of all landings in 1996 - accounting for 40 per cent of the total in 2006, the same proportion as demersal fish.

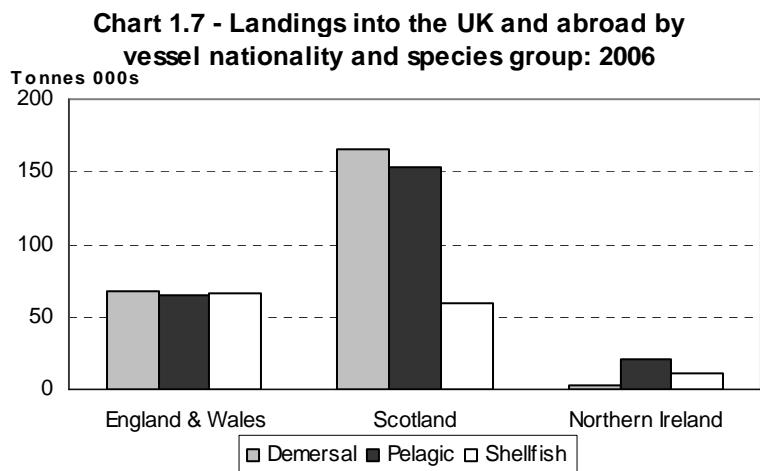

**Chart 1.5 - Value of landings by UK vessels**

In 2006, the Scottish fleet's share of total landings was 62 per cent, down from 67 per cent in 1996. Over the same period, there have been increases for the English and Welsh fleet (up to 32 per cent from 29 per cent) and for the Northern Irish fleet (up to 6 per cent from 3 per cent).

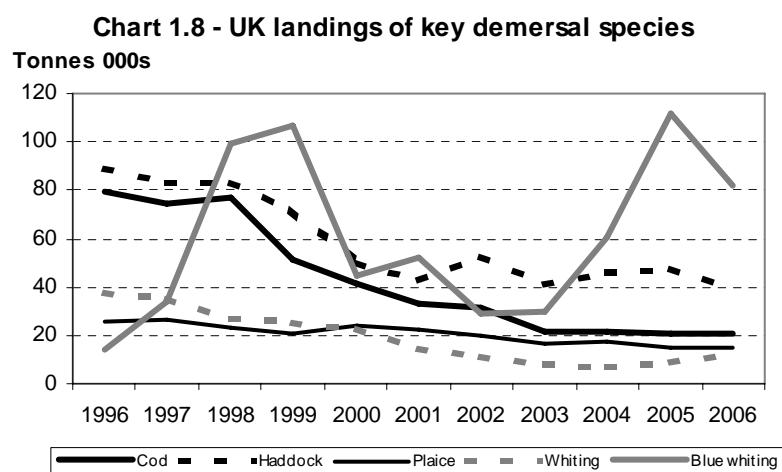

In terms of quantity, the Scottish fleet's catch was dominated by landings of demersal and pelagic fish. The Northern Irish catch was mainly pelagic while the English and Welsh catch was evenly spread across all species groups.

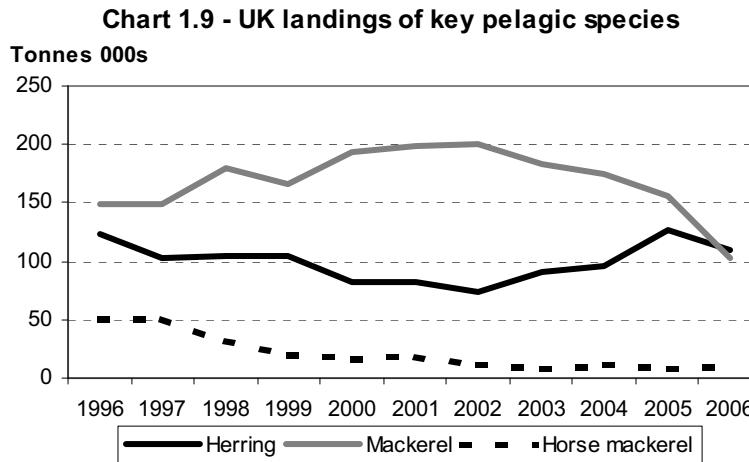

### 1.3 Catch, by individual species

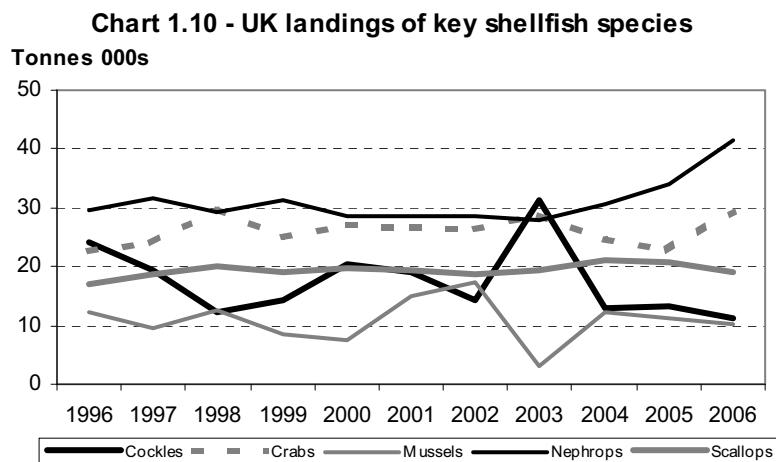

Landings by UK vessels for five key demersal species are shown below.

Falling catches of cod and haddock have been a contributing factor in the large reduction in demersal landings since 1996. In 2006, the UK fleet landed 21 thousand tonnes of cod (26 per cent of the 1996 level) and 40 thousand tonnes of haddock (44 per cent of the 1996 level). This represents a combined decrease of 109 thousand tonnes. Landings of the relatively low value blue whiting have increased over this period from 14 thousand tonnes to 82 thousand tonnes.

Herring landings by the UK fleet were higher than mackerel landings for the first time in over 10 years. Since 2002, mackerel landings have decreased by 49 per cent while herring landings have increased by 50 per cent.

In 2006, 41 thousand tonnes of nephrops were landed, a 35 per cent increase in two years. Landings of cockles fell to their lowest level for over 10 years.

## 1.4 Landings into UK ports

Table 1.1 shows the three ports for each UK country with the highest quantity and value of landings. In 2006, the ports of Peterhead, Lerwick and Fraserburgh accounted for 49 per cent by quantity and 36 per cent by value of all landings by UK vessels into the UK.

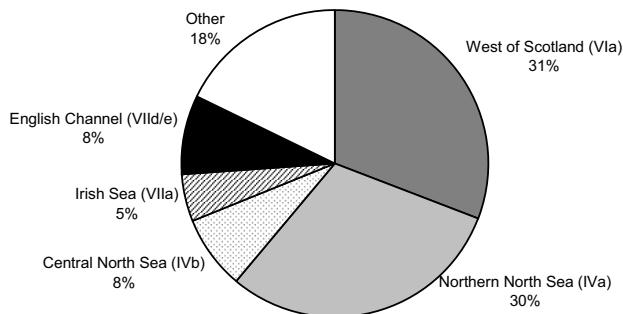

**Table 1.1 - Landings by UK vessels into major ports: 2006**

	Demersal		Pelagic		Shellfish		Total	
	000t	£m	000t	£m	000t	£m	000t	£m

Portavogie	0.7	1.2	0.0	0.0	2.1	3.8	<b>2.8</b>	<b>5.1</b>

## 1.5 Catch, by sea area

In 2006, 61 per cent of all landings by UK vessels were caught off the West of Scotland and in the Northern North Sea (Areas VIa and IVa – see Chart 3.7 for a map of fishing areas).

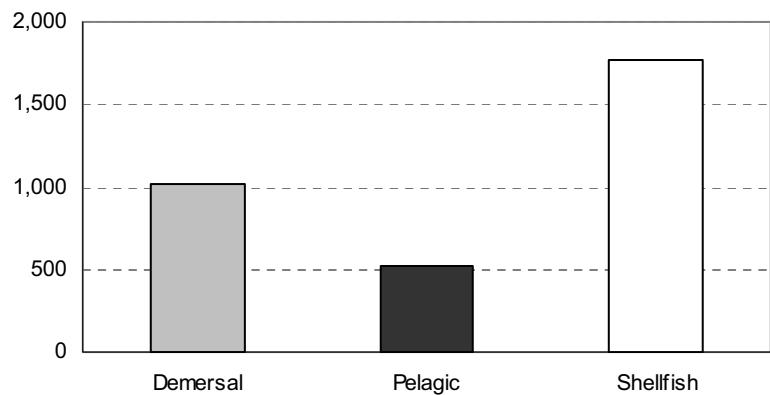

**Chart 1.11 - Catch by sea area, UK vessels: 2006**

## 1.6 Average value

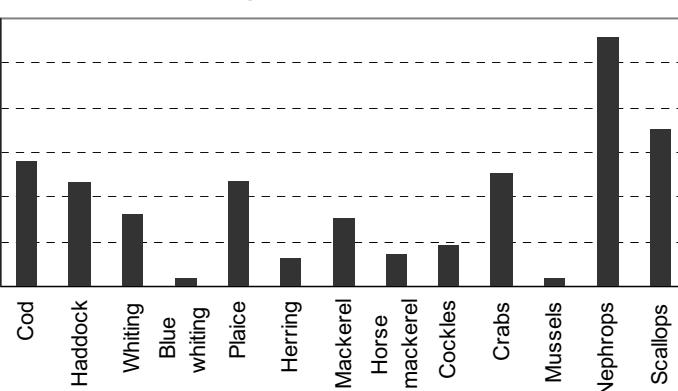

In 2006, the average value of shellfish was around £1,750 per tonne (live

**Chart 1.12 - Average live weight value: 2006**  
£ per tonne

weight) compared with around £1,000 per tonne for demersal species and around £500 per tonne for pelagic species. Figures for key species are shown below.

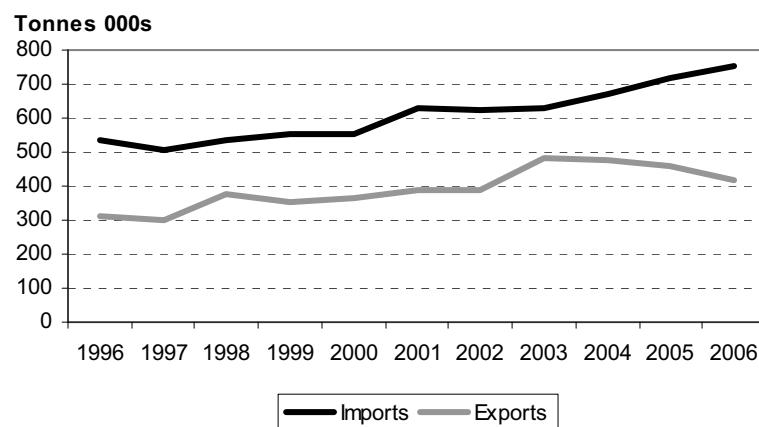

**Chart 1.13 - Average live weight value of key species: 2006**

## 1.7 Imports and Exports

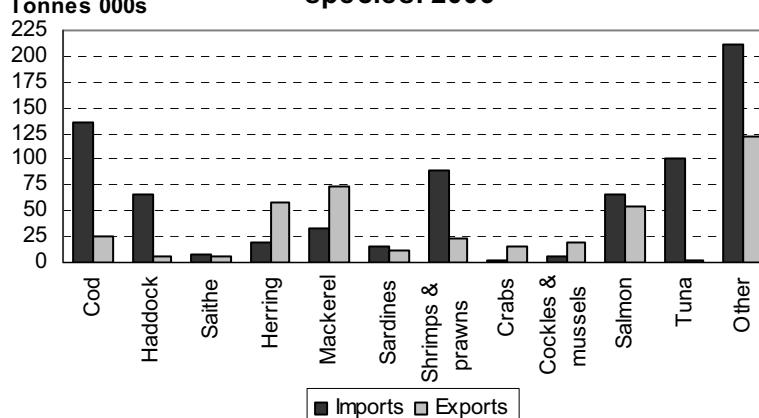

In 2006, imports of fish and fish preparations rose to 753 thousand tonnes. This is 19 per cent higher than in 2003. Over the same period, exports fell by 13 per cent to 416 thousand tonnes.

**Chart 1.14 - UK imports and exports**

Imports were highest for cod, haddock, tuna, shrimps and prawns. The UK exported mostly mackerel, herring and salmon.

**Chart 1.15 - UK imports and exports by key species: 2006**

In 2006, imports were highest from Iceland (98 thousand tonnes), Norway (61 thousand tonnes), Denmark (58 thousand tonnes) and the Faroe Islands and China (47 thousand tonnes each). The UK exported mostly to Netherlands (84 thousand tonnes), France (81 thousand tonnes), Spain (42 thousand tonnes) and Russia (40 thousand tonnes).

Full details are in Chapter 4.

## **1.8 The wider fishing industry**

Table 1.2 provides key economic indicators and summary statistics for the fishing industry.

As well as fishermen, the UK has a substantial fish processing industry of around 570 businesses, which employ some 18,180 people. At the retail level are approximately 1.3 thousand fishmongers, including mobile fish vans and market stalls. Around 85 per cent in volume and 80 per cent in value of chilled and frozen products are sold through supermarkets. This does not include canned produce. Fish is also consumed in restaurants and in take away form from fish and chip shops. A small proportion of the catch is used to make fish oils and animal feeds.

## **1.9 Administration of the UK fishing industry**

Fisheries Administrations in the UK are comprised of the Department for Environment, Food and Rural Affairs (Defra) and the Marine and Fisheries Agency (MFA), the Marine Directorate, Scottish Executive, the National Assembly for Wales Agriculture Department (NAWAD), and the Department of Agriculture and Rural Development for Northern Ireland (DARD). Departments in the Isle of Man, Jersey and Guernsey are responsible for administering fishing activity in their respective areas.

## **1.10 Fishing in Europe and in the rest of the world**

The primary aim of the European Union's Common Fisheries Policy (CFP) is to ensure rational and sustainable exploitation of fish stocks through conservation and management policies designed to protect resources and reflect the needs of the fishing industry. Structural policies are aimed at improving the balance between catching capacity and available resources by addressing fishing effort. Conservation policies are aimed at regulating the quantities of fish caught, through a system of Total Allowable Catches (TACs) based on scientific advice. These TACs are allocated as quotas to EU Member States in accordance with fixed keys based on historic fishing rights. They are complemented by a series of technical conservation measures intended to achieve more selective fishing, for example by setting rules on minimum landing sizes, minimum mesh sizes and gear design, as well as defining areas of seasonal closures, methods of fishing and target species. Opportunities to fish in third country waters are also secured through the CFP.

Chapter 5 has information on the main EU quota stocks and their level of exploitation. Comparisons between the UK fishing industry and the rest of Europe are included in Chapter 6. An overview of the world fishing industry is in Chapter 7.

## **1.11 Fish Producer Organisations**

Fish Producer Organisations (FPOs) are established under the CFP to enable groups of fishermen to market the fish they catch. In 1985 FPOs were given the opportunity to manage allocations of some whitefish stocks subject to TAC restrictions in the North Sea (Area IV) and West of Scotland (Area VI). In 1991 this opportunity was extended to TAC whitefish stocks in the English Channel and Western waters (Area VII). Since 1995, FPOs wishing to manage quota allocations for whitefish stocks in Areas IV, VI and VII have been required to do so for all such stocks; a similar requirement for pelagic stocks was introduced in 1999. Allowing FPOs to take on this management responsibility enables them to plan their uptake of their particular allocations to optimise the benefit to their members. In 2006 there were 19 FPOs in the UK, and in addition there were also five other groups with separate allocations; the 10 metre and under fleet, the non-sector, the Isle of Man non-sector, the Lunar Group which manages its own allocations for pelagic stocks, the South West handliners which have a separate allocation for Western mackerel and Mourne inshore fishermen who have a separate allocation for Irish Sea herring. Furthermore from 1 January 2003, FPOs have had the opportunity to manage allocations for deep sea stocks.

## **1.12 Sea Fisheries Committees**

Sea Fisheries Committees (SFCs) were established in the 19th century and are empowered to make by-laws for the management and conservation of their districts' fisheries. Their powers have been further extended to enable them to regulate fishing activity for the purpose of environmental protection. There are twelve SFCs which regulate local sea fisheries around virtually the entire coast of England and Wales out to 6 miles. In certain coastal areas and estuaries the Environment Agency has the powers of an SFC. The powers of SFCs are being reviewed through the forthcoming Marine Bill and proposals aim to deliver a fully effective management service fit for the 21<sup>st</sup> Century.

## **1.13 Statistics for managing fisheries**

Prior to 1984, all UK catch statistics were provided to the Fisheries Administrations on a voluntary basis. Since that year the regulations of the CFP have required those UK vessels which account for most of the fish caught to provide to the Sea Fisheries Inspectorates of the respective Fisheries Administrations, located at the main ports, information on each trip including the main species caught, the area of capture, and the quantities landed. Additional information is collected to complete, as far as possible, the coverage of fishery activity. The combined data provide the main source of catch and landings statistics for UK vessels as recorded in the tables in this publication. (For further information regarding the statistical methodology see Appendix 2 of this publication).

The catch and landings statistics provide a system for monitoring the uptake of the UK share of stocks for which annual TACs are set. In any year once the quota has been taken the fishery is closed.

- (a) GDP for fishing includes landings abroad.
- (b) Year-on-year comparisons may be affected by changes in the industrial classification of some contributors. For most businesses data are appropriate to a single activity heading; where information covers a mixture of activities, the business is classified according to the main activity.
- (c) The number of vessels excludes those registered in the Channel Islands and Isle of Man.
- (d) Figures for 1999 to 2004 have been revised following a correction to an error found when producing aggregate results from sample data.
- (e) The quantity of landed fish is expressed in terms of liveweight. The figures relate to landings both into the UK and abroad.
- (f) Imports are valued at cost, including insurance and freight terms whereas exports are valued at free on board terms.
- (g) Data are derived from the National Food Survey prior to 2001, and from the Expenditure and Food Survey for 2001 onwards. Figures for 2001 onwards are based on financial year data.
- (h) Including non-alcoholic beverages.
- (i) The landed price index has been calculated on an annual basis with 1987 = 100
- (j) The fish component of the RPI which includes canned and processed fish. The Index is calculated on a monthly basis with January 1987 = 100

## 2 The structure of the UK fishing industry

### 2.1 Introduction

Statistics on the UK fishing fleet since 1990 have been based on the fleet of fishing vessels as registered with the Register of Shipping and Seamen, part of the Maritime and Coastguard Agency which is an executive agency of the Department for Transport. Information provided by the Registry includes the length (overall and registered), breadth, gross tonnage, power, age and material of construction. Information on the fishing fleets of the Isle of Man, Guernsey and Jersey are supplied by the respective registering authorities. Prior to 1990, the statistics were based on fishing vessels known by Departments to be active.

Statistics on the size of the UK fishing fleet are complicated by the fact that the European Union has been progressively altering the methodology used to determine vessel tonnage for the fishing fleet from various national and international standards, previously collectively called GRT, to a common standard based on the International Tonnage Convention 1969 (ITC69) and known as Gross Tonnage (GT). A phased programme of re-measurement was introduced in the UK in 1996 which was completed by the early part of 2004.

Vessel tonnage is a volumetric measure, but there is no simple relationship between the various types of GRT and GT. For any given vessel, a GT figure can only be obtained by physical measurement or, in the case of smaller vessels, by using formulae provided by the EU designed to give an approximation. GT figures are often higher than GRT figures for the same vessel; the range of outcomes can be as low as 50 per cent or as high as 300 per cent of the original tonnage depending on the individual vessel characteristics; for large vessels, GT is almost always higher than GRT.

Licensing of vessels first applied in 1977 and covered only fishing vessels over 40 feet (12.14 metres) in certain fisheries. Following the adoption of the European Union's Common Fisheries Policy, the UK designated a number of fish stocks as pressure stocks and introduced a restrictive licensing scheme for vessels fishing those stocks. The licensing regime initially only covered vessels over 10 metres registered length, but its coverage has been progressively extended over the years. In February 1990 the licensing regime was extended to vessels of over 10 metres overall length fishing for TAC stocks. Later the same year restrictive licensing was extended to cover all fishing by vessels over 10 metres overall length with the exception of those fishing for salmon and migratory trout which were covered by a separate regime. From May 1993 licensing was extended to vessels of 10 metres and under overall length.

## **2.2 Fleet structure, Multi-Annual Guidance Programmes and the Fleet Entry:Exit Regime**

The Multi-Annual Guidance Programmes of the CFP provide a framework for bringing fleet capacity across the EU in line with the available fishing opportunities. The fourth such programme covering the years 1997-2001 was agreed in 1997, and extended to run until the end of 2002. As with previous plans, each member state's fleet was subdivided into segments. Capacity (in terms of total tonnages and engine power) or effort reduction targets were set for each of these segments, with the targets being tailored to the particular circumstances of each member state's fleet. In the UK these segments were based on the recorded activity of fishing vessels, with each vessel attributed to a segment on the basis of the fishing activity it carries out most often.

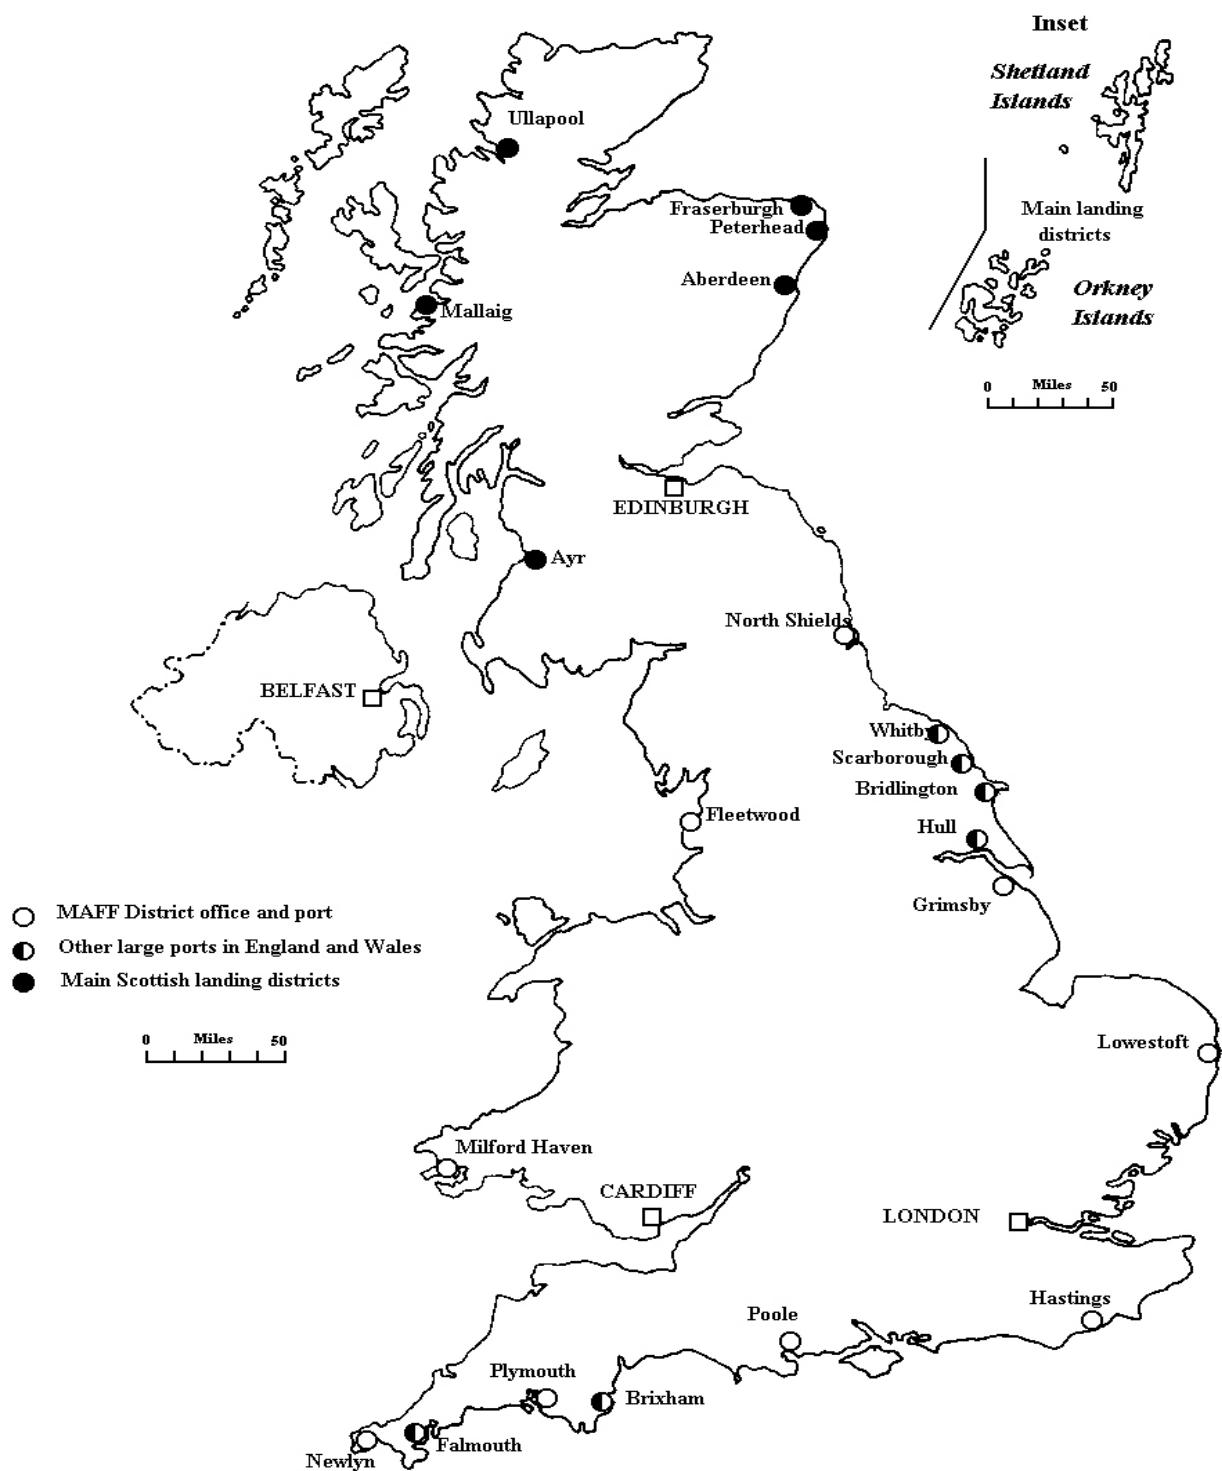

Table 2.2a shows the development in vessel numbers, tonnage and engine power in 2006 compared with the situation in 2005. Table 2.2b shows the size of the UK fishing fleet as a whole since 1997. The series for GT\* (see appendix 1) reflects vessels which had remeasured to ITC69 by the end of 2003.

As part of the review of the CFP carried out by the Commission and member states during 2002, it was agreed that the MAGP would be replaced by an Entry:Exit regime. The aim of this regime is to limit the level of fleet entries to ensure that they are matched by fleet exits where appropriate. The exact rules for the implementation of this regime across the EU were finalised during 2003. While a ceiling for the total capacity in tonnage and in engine power for the UK fleet still exists, individual targets for fleet segments are no longer set. Therefore the changes in the levels of tonnage and engine power for the fleet segments from the end of 2004 in Table 2.2a do not give rise to any breach of objectives. The EU Entry:Exit regime in fact is very similar to the existing licensing regime in the UK, which prevents the creation of new fishing capacity as any new vessel must obtain a licence to fish from existing vessels. The UK licensing regime also prevents a significant movement of capacity between segments.

## **2.3 Number of fishermen**

Statistics on the number of fishermen are drawn from surveys carried out by the Marine and Fisheries Agency in England and Wales, by the Sea Fisheries Inspectorate in Northern Ireland and by the Sea Fisheries Protection Agency in Scotland.

**Chart 2.1 Main ports (England and Wales) and landing districts (Scotland)**

(1) With effect from 31 December 2002, the last phase of the EU Fishing Fleet Multi Annual Guidance Programme ended. From then on Member States have not had to operate limits for their fleet segments. As a consequence, segmentation of the fleet for MAGP purposes is no longer carried out, hence the introduction of an "unknown" segmentation group. 2005 figures have been revised.

**TABLE 2.2b The size of the UK fishing fleet: 1997 to 2006<sup>(a)</sup>**

- (a) Prior to 1952 figures were based on information supplied by the Registrar General of Shipping and Seamen. Since 1952 figures have been supplied by the District Fishery Officers of Defray.
- (b) From 1966 these figures exclude 'hobby' fishermen, i.e. fishermen who do not fish commercially. The corresponding figures for Scotland and Northern Ireland have never included 'hobby' fishermen.
- (c) Includes 1986 figures for Newlyn and Plymouth.
- (d) The apparent increase in fishermen in Scotland reflected the licensing of 10m & under vessels; when more information became available on the numbers of such active vessels.

### 3 Catches and landings data

#### 3.1 Summary

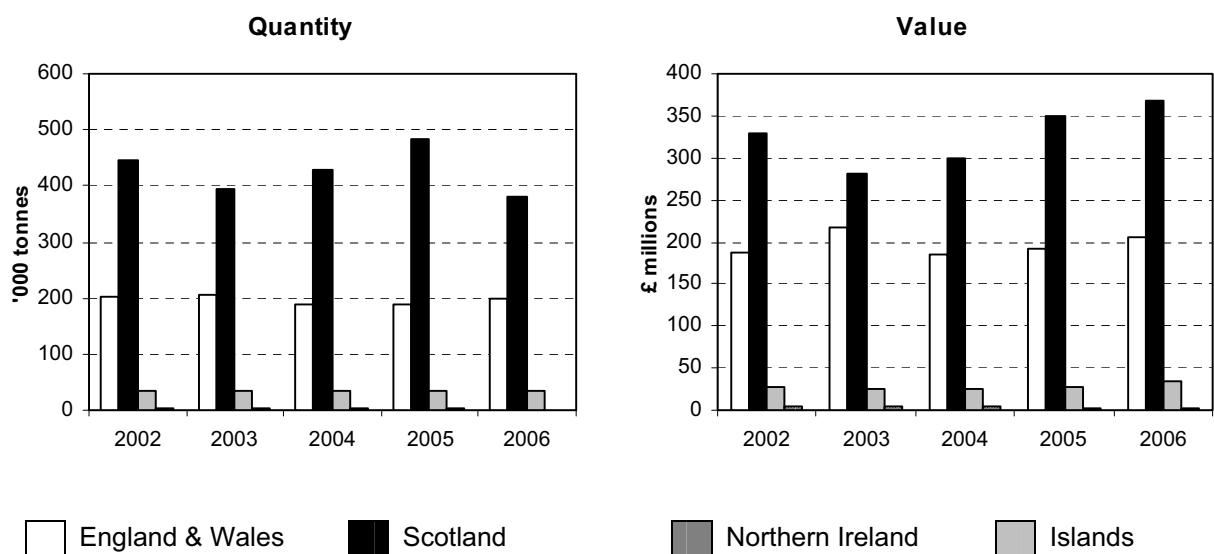

This chapter brings together the information available for quantity, value, species and area of capture by UK vessels landing into the UK and abroad and foreign vessels landing into the UK. The landings data are given in terms of live weight.

In 2006, UK vessels, including the Channel Islands and Isle of Man vessels, landed in the UK and abroad 614 thousand tonnes of sea fish (including shellfish) with a value of £610 million. Compared with 2005, this represents a 13 per cent decrease in quantity and a 7 per cent increase in value.

Around 68 per cent of fish taken by the UK fleet were landed in the UK, the remainder being landed at ports abroad. In terms of value, 81 per cent of UK vessel landings were made in the UK.

Vessels with Department of Administration in Scotland accounted for 62 per cent of the weight and 60 per cent of the value of landings by UK vessels. English and Welsh vessels accounted for 32 per cent of the quantity and 34 per cent of the value of the landings, while Northern Irish vessels represented 6 per cent by quantity and 5 per cent by value. An alternative representation of landings by department of administration can be seen in Chart 3.1.

**Chart 3.1 Quantity and value of landings into the UK and abroad by UK vessels by Department of Administration: 2002 to 2006**

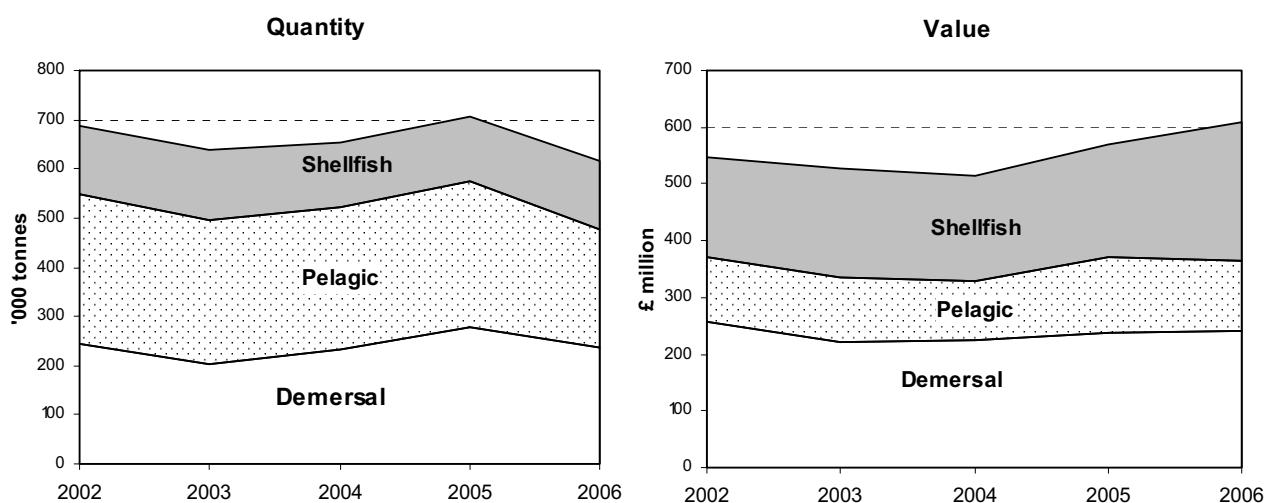

In 2006, 61 per cent of all landings by UK vessels were caught in two areas: West of Scotland - Area VIa (190 thousand tonnes) and Northern North Sea - Area IVa (186 thousand tonnes).

### 3.2 UK landings

Landings by UK vessels into the UK have fallen to 417 thousand tonnes from 492 thousand tonnes in 2005. Demersal species represented 34 per cent of total landings in terms of quantity and 37 per cent in terms of value. Pelagic species also accounted for 34 per cent of landings by quantity but only 15 per cent by value. Shellfish accounted for 32 per cent of landings by quantity and 48 per cent by value. In 2006, 25 per cent of all UK landings by UK vessels were landed in Peterhead and 17 per cent were landed in Lerwick.

Landings by UK vessels into the UK and abroad are shown in Chart 3.2.

**Chart 3.2 Landings into the UK and abroad by UK vessels: 2002 to 2006**

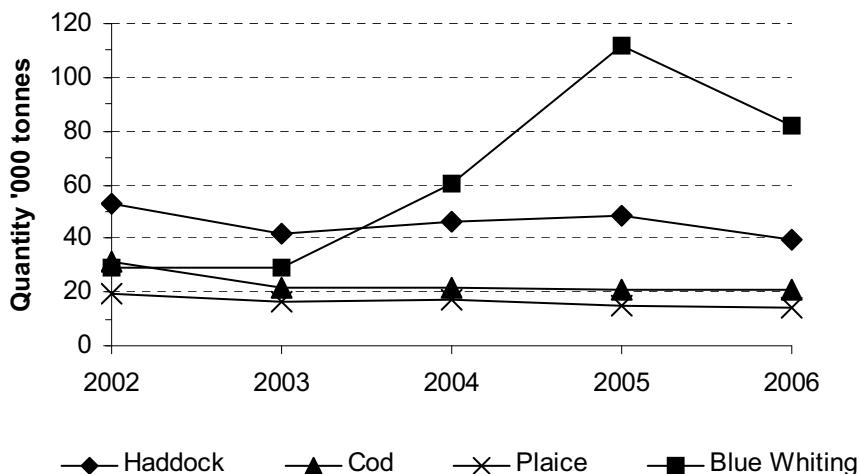

#### 3.2.1 Demersal fish

In 2006, 82 thousand tonnes of blue whiting were landed by UK vessels into the UK and abroad, a decrease of 27 per cent on 2005. These landings accounted for 35 per cent of all demersal landings but only 3 per cent of the value.

Landings of cod have decreased by 34 per cent since 2002 and haddock landings have decreased by 25 per cent (Chart 3.3). A more detailed species breakdown of demersal landings in the UK by both UK and foreign vessels and of landings abroad by UK vessels can be found in Table 3.3.

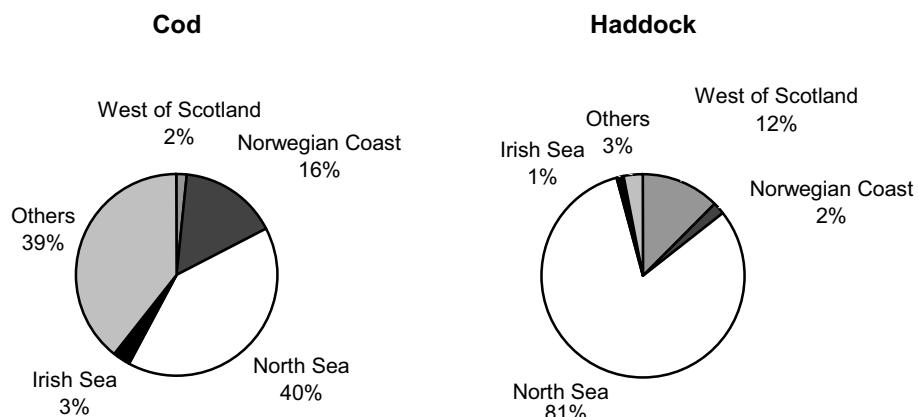

Of the 21 thousand tonnes of cod landed by UK vessels into the UK and abroad in 2006, 56 per cent (12 thousand tonnes) were caught in the Northern North Sea - Area IVa and in the waters of Bear Island and Spitzbergen – Area IIb.

**Chart 3.3 Demersal landings into the UK and abroad by UK vessels: 2002 to 2006**

Of the 40 thousand tonnes of haddock landed by UK vessels in 2006, 74 per cent (29 thousand tonnes) were caught in the Northern North Sea – Area IVa. See Chart 3.4 for a breakdown by area.

**Chart 3.4 Percentage of cod and haddock landed by UK vessels by area of capture: 2006**

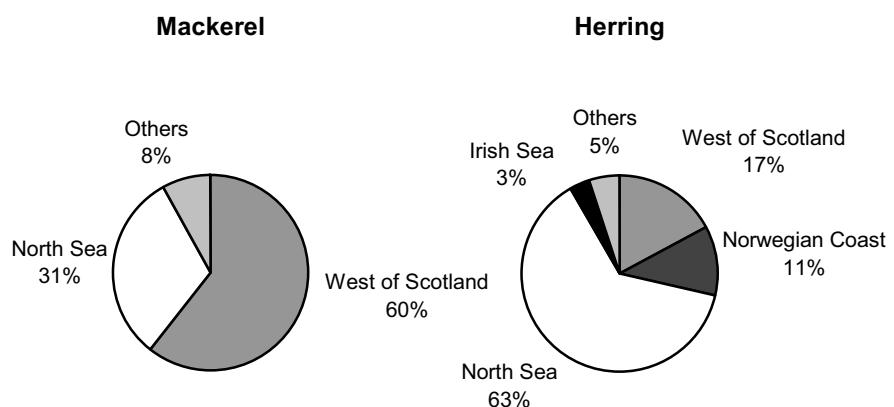

### 3.2.2 Pelagic fish

Mackerel and herring are the two main pelagic species landed by UK vessels into the UK and abroad accounting for 89 per cent by weight and 92 per cent by value of the total pelagic landings in 2006. Landings of herring have increased by 50 per cent since 2002 while landings of mackerel have fallen by 49 per cent. In 2006, mackerel landings were valued at £80 million, 13 per cent of the total for all sea fish (including shellfish). A more detailed species breakdown of pelagic landings in the UK by both UK and foreign vessels and of landings abroad by the UK fleet can be found in Table 3.3.

Of the 110 thousand tonnes of herring landed by UK vessels in 2006, 58 per cent (63 thousand tonnes) were caught in the Northern North Sea - Area IVa and 17 per cent (19 thousand tonnes) were caught off the West of Scotland - Area VIa.

Of the 103 thousand tonnes of mackerel landed by UK vessels into the UK and abroad in 2006, 60 per cent (62 thousand tonnes) were caught off the West of Scotland - Area VIa and 31 per cent (32 thousand tonnes) in the Northern North Sea - Area IVa. See Chart 3.5 for a breakdown by area.

**Chart 3.5 Percentage of mackerel and herring landed by UK vessels by area of capture: 2006**

### 3.2.3 Shellfish

The two main species of shellfish landed by UK vessels into the UK and abroad are nephrops and crabs. In 2006, nephrops accounted for 30 per cent of shellfish landings by weight and crabs accounted for 21 per cent. Landings of nephrops have increased by 45 per cent since 2002 while landings of crabs have increased by 12 per cent. These two species accounted for 63 per cent of the total shellfish value and scallops accounted for 14 per cent. A more detailed species breakdown of shellfish landings in the UK by both UK and foreign vessels and of landings abroad by UK vessels can be found in Table 3.3.

Of the 30 thousand tonnes of crabs landed by UK vessels into the UK and abroad in 2006, 28 per cent (8 thousand tonnes) were caught off the West of Scotland - Area VIa, 19 per cent (6 thousand tonnes) were caught in the Central North Sea - Area IVb and 17 per cent (4 thousand tonnes) were caught in the English Channel – Area VIId/e.

Of the 41 thousand tonnes of nephrops landed by UK vessels in 2006, 33 per cent (14 thousand tonnes) were caught off the West Of Scotland - Area VIa and 30 per cent (13 thousand tonnes) were caught in the Northern North Sea - Area IVa. See Chart 3.6 for a breakdown by area.

## 4 Supplies, overseas trade and marketing

This chapter brings together the information on the fish available for consumption, imports, exports, prices and household consumption. The landings data are given in terms of landed weight. The trade data are shown in terms of actual product weight.

### 4.1 Partial Balance Sheet for the UK

Chart 4.1 shows a partial balance sheet for the UK. Details are given in Table 4.1 - separate tables are given for demersal, pelagic and shellfish, and within these groupings, for particular species. In aggregate terms, the UK has been a net importer of fish throughout the period 1997 – 2006.

**Chart 4.1 International trade of fish: 1997 to 2006**

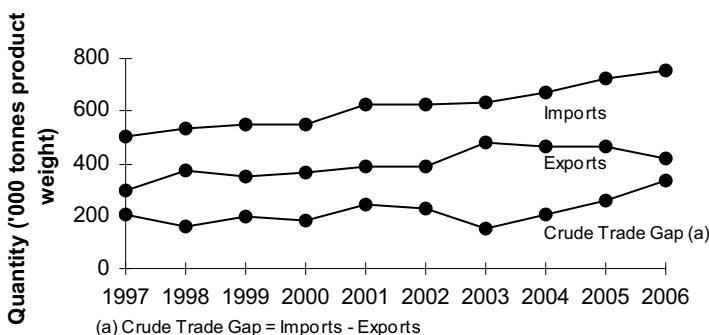

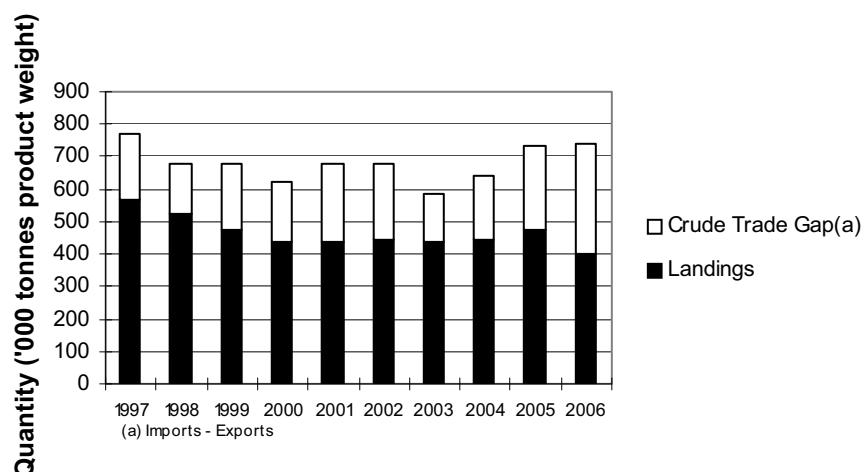

Chart 4.2 shows that landings by UK vessels into the UK fell from 568 thousand tonnes landed weight in 1997 to 401 thousand tonnes in 2006. More detailed landings data (based on live weight) can be found in Chapter 3. Adding the crude trade gap to the landings gives us a figure for the total available for domestic (UK) use. This fell from 772 thousand tonnes in 1997 to 588 thousand tonnes in 2003. Since then, the crude trade gap has increased and the total available for domestic use was 737 thousand tonnes in 2006.

**Chart 4.2 Total fish available for domestic use in the UK: 1997 to 2006**

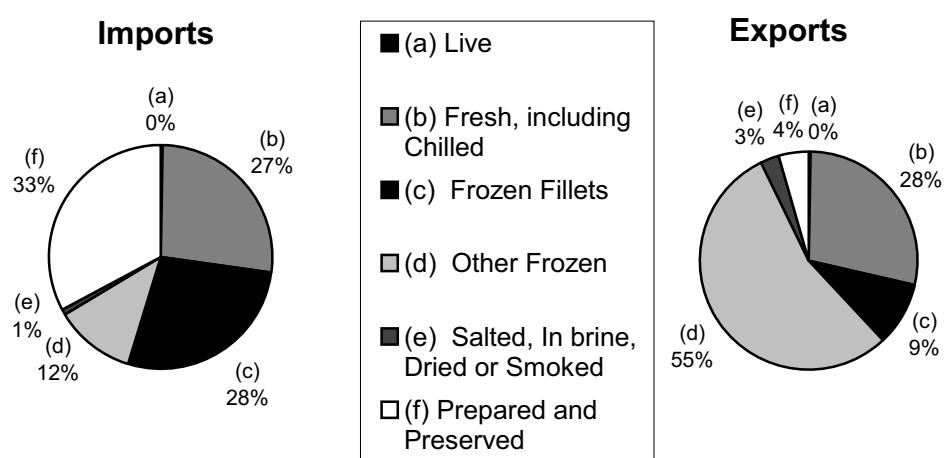

## 4.2 Imports

Total imports of fish and fish preparations have increased from 503 thousand tonnes in 1997 to 753 thousand tonnes in 2006. In terms of value, total imports rose to £1,919 million in 2006, 13 per cent higher than in 2005.

Demersal and pelagic fish and fish products accounted for 85 per cent of total imports by weight and 78 per cent of total imports by value in 2006. Prepared and preserved fish accounted for 33 per cent of total demersal and pelagic fish and fish products imported into the UK by weight; frozen fillets for 28 per cent; other frozen products for 12 per cent and fresh, including chilled, for 27 per cent. A more detailed breakdown of both quantity and value of imports can be found in Table 4.2.

**Chart 4.3 Quantity of demersal and pelagic fish and fish preparations imported into the UK and exported from the UK: 2006**

In 2006, the UK imported 209 thousand tonnes of prepared or preserved demersal and pelagic fish. Of this, 100 thousand tonnes were tuna, and a further 22 thousand tonnes were salmon. The highest quantities of prepared or preserved demersal and pelagic fish were imported (in descending order of quantity) from the Seychelles, Mauritius and Thailand. Further information on the country of origin of UK imports can be found in Table 4.4.

In 2006 the UK imported over 21 thousand tonnes of fresh or chilled cod and 30 thousand tonnes of fresh or chilled haddock. In addition 93 thousand tonnes of frozen cod fillets and 16 thousand tonnes of other frozen cod were imported.

The main types of shellfish imported into the UK in 2006 were shrimps and prawns, of which 43 thousand tonnes were imported in the form of fresh, chilled, frozen or semi-preserved. The main type of prepared or preserved shellfish were also shrimps and prawns, with 47 thousand tonnes imported.

In total in 2006, the UK imported 17 thousand tonnes of shellfish from Iceland, 13 thousand tonnes from India and 12 thousand tonnes from Denmark.

### **4.3 Exports**

In 2006, total exports of fish and fish preparations fell by 10 per cent to 416 thousand tonnes and total value rose by 1 per cent to £944 million.

In 2006, demersal and pelagic fish and fish products accounted for 75 per cent of total exports by weight and 60 per cent by value. Fresh, including chilled fish, accounted for 28 per cent of total demersal and pelagic fish and fish products exported from the UK by weight. Frozen fillets accounted for 9 per cent, other frozen products for 55 per cent and prepared and preserved products for 4 per cent of demersal and pelagic fish exports. A more detailed breakdown of both quantity and value of exports can be found in Table 4.3.

In 2006, the UK exported 88 thousand tonnes of fresh demersal and pelagic fish (including chilled). Of this total, 43 thousand tonnes were salmon.

In 2006, the UK exported 105 thousand tonnes of shellfish and shellfish preparations. Of this, 25 thousand tonnes were to Spain and 20 thousand tonnes were to France.

### **4.4 Prices**

The average annual prices quoted in this publication are based on realisations for first-hand sales of fish to all outlets, i.e. for human consumption and for other uses such as fish meal and animal feeding stuffs. These prices are calculated using the equivalent live weight. In 2006 the average annual price of fish was £1,185 per tonne. This is a 28 per cent increase on 2005. In 2006, the average annual price for demersal fish increased by 19 per cent to £1,313 per tonne; the price of pelagic fish increased by 8 per cent to £506 per tonne; and the total shellfish price increased by 20 per cent to £1,778 per tonne. A more detailed breakdown of the prices for individual species for selected years can be found in Table 4.10.

- (a) Salmon and trout are excluded from the landings data.
- (b) Landings are given in terms of landed weight equivalent (i.e. head on, gutted for most species).
- (c) Landings include transhipments of mackerel.
- (d) Total Available for Domestic Use figures have been revised. Total Available for Domestic Use = Total Supplies - Exports.
- (e) The processing figures are supplied by FAO.
- (f) The fish component of the RPI. The Index is calculated on a monthly basis with January 1987 = 100.

(a) 2006 data on imports are provisional

(b) Fillets are expressed in terms of product weight. Excludes herring, salmon and trout

(c) Includes pelagic fish other than herring, which are not separately identifiable

(d) Large amounts of salmon and trout are imported as prepared and preserved fish (See Table 4.2)

(e) Includes live fish not previously identified

- (a) Data for the years 1938 to 1987 were originally calculated on a standard landed weight basis. These data have been converted to a liveweight basis for comparison purposes; however they should not be regarded as showing the accurate liveweight price but may be used to indicate trends
- (b) Average values for the UK not available. Landings in Scotland of the species in the years indicated were included with "Other Demersal" or "Other Shellfish".
- (c) Prior to 1972 landings of Scallops and Queens were not separately identifiable and were entered under one heading of Scallops.

## 5 Main stocks and their level of exploitation

By Dr Carl M. O'Brien, Senior Fisheries Science Advisor at Cefas

### 5.1 The management of stocks

Fisheries are managed using a Total Allowable Catch or TAC (corresponding to a particular harvesting rate), and technical measures (mainly mesh sizes and minimum landing sizes, but sometimes closed areas, which determine the smallest fish that can be caught and landed) based on scientific advice.

In the EU, the TAC is set each year by the Council of Ministers following negotiations on catch options that are provided by the Advisory Committee on Fishery Management (ACFM) of the International Council for the Exploration of the Sea (ICES), an independent scientific body. For the main North Sea stocks these options take into account the terms of a management agreement between the EU and Norway. Once a TAC is agreed for each stock and fishing area it is allocated as quotas to Member States in accordance with fixed keys based on historic fishing rights (see Chapter 1).

In recent years, some seriously depleted stocks have become the subject of emergency measures and recovery plan proposals. Since 2003, the TAC and fishing mortality implemented for these stocks has been linked to effort control measures that restrict the number of fishing days at sea per month permitted for fleets capturing recovery species.

### 5.2 Scientific assessment and advice

ICES advice is based on stock assessments carried out at international working groups, where fishery scientists from the UK and the other exploiting nations compile fisheries data, biological data and survey data for use in fisheries science models. The age structure of a stock (the relative proportion of the different age groups) is largely determined by the fishing rate and by the numbers of young fish that enter the stock each year. When information on age structure is combined with data on landings, fishing effort, and the results of standardised stock surveys carried out by research vessels, the models are able to estimate the historical trend in fishing rate and stock abundance, up to the last full year of data. The assessment is then used to forecast the expected catch in an upcoming TAC year for a range of fishing rate options, taking into account the number of young fish that are expected to enter the stock, based either on survey data, or a recent historical average.

Scientists describe the state of the stocks in terms of the spawning stock biomass (SSB, the weight of mature fish), the fishing rate ( $F$ ), and the number of juvenile fish or recruits in each year-class (see Appendix 1 for definitions of these terms). Since 1999 the ICES advice has identified which catch options meet precautionary criteria. These criteria aim to ensure sustainability by keeping spawning biomass above a minimum

precautionary level,  $B_{pa}$  (set high enough to allow a margin of error sufficient to keep SSB above a lower limit level,  $B_{lim}$ ), and keeping the fishing rate below a maximum precautionary level,  $F_{pa}$  (set low enough to allow a margin of error sufficient to keep F below an upper limit level,  $F_{lim}$ ).  $B_{lim}$  is therefore below  $B_{pa}$ , and  $F_{lim}$  is above  $F_{pa}$ .

The following section summarises the present state of the main stocks based on advice from the ACFM meetings of May/June and October 2006, which evaluated stock assessments using fisheries data for years up to and including 2005, and survey data up to and including 2006. The 2006 ACFM advice formed the basis for the EU proposals that led to the TACs and other measures agreed for 2007 by the EU Council of Ministers.

Full details are contained within Council Regulation (EC) No 41/2007 of 21 December 2006 fixing for 2007 the fishing opportunities and associated conditions for certain fish stocks and groups of fish stocks, applicable in Community waters and, for Community vessels, in waters where catch limitations are required.

### **5.3 The State of the Main Stocks**

#### **5.3.1 North Sea roundfish**

The main North Sea roundfish stocks are those for *cod*, *haddock*, *whiting* and *saithe*, whose landings have all declined since their high point in the 1970s and/or 1980s.

The *cod* stock remains seriously depleted. The international fishing rate has been high since the 1980s, reaching an historic high in 1999 and has shown a decline since 2000. The SSB fell to an historic low in 2001. The number of young cod (recruitment) has been low since 1987, and even lower since 1998, causing serious concern. Since 2000, ICES advised that the TAC should be very low, or zero, and the EU reduced the TAC from 81,000 tonnes in 2000 to 48,600 tonnes in 2001, 49,300 tonnes in 2002, and 27,300 tonnes in 2003 and 2004. The minimum mesh size in the directed fisheries for cod, haddock and whiting was also increased to 120mm in 2003. The 2006 ICES assessment indicates that the 2001-2004 year-classes are all well below the average; the 2005 year-class is estimated from surveys to be more abundant but still below the average. In 2004, agreement was reached within the EU on a formal recovery plan that was operational during the TAC and management decision processes of 2004, effectively rendering the plan operational in 2005. The EU TAC for 2007 is set at 19,957 tonnes, compared with 23,205 tonnes in 2006, and 27,300 tonnes in 2005.

For *haddock*, the fishing rate has fluctuated at a high level since the 1970s, and SSB has fluctuated around the precautionary biomass, depending on the variation in recruitment. The 2006 assessment shows that haddock fishing mortality has declined sharply from the high point, and that SSB has increased due to the outstanding 1999 year-class, which is now being replaced by poorer year-classes. The haddock TAC was set at 66,000 tonnes for 2005, 51,850 tonnes for 2006 and 54,640 tonnes for 2007.

The status of *whiting* is unknown. Different data sources give conflicting information on the development of this stock. Total catches (landings and discards combined) have been gradually decreasing since 1976 but the whiting TAC is 23,800 tonnes for 2007, the same as in 2006, but representing a decrease from 28,000 tonnes in 2005.

For *saithe*, fished mainly in the northern North Sea, the fishing rate has been falling since the 1980s, and the stock has been increasing since 1992, and it is now above the precautionary level. The perceived increase in the stock in recent years estimated in the 2006 assessment is similar to that estimated in the 2005 assessment, so that the basis of ICES advice is unchanged and the TAC for 2007 is 123,250 tonnes, the same as in 2006, compared with 145,000 tonnes in 2005.

#### 5.3.2 North Sea flatfish

The main stocks are the *plaice* and the *sole*. Since 2004, the *plaice* assessments have included estimates of discards, which have increased in recent years. This has changed the perception of the plaice stock relative to precautionary levels. It shows landings and SSB falling steeply after 1990 as the fishing rate increased to a peak in 1997, with SSB currently close to an historic low and below  $B_{pa}$ , yet above  $B_{lim}$  (previously estimated well below this level), and with the fishing rate remaining high. A long-term management plan for North Sea plaice and sole has been under development within the European Commission – final details are contained within Council Regulation (EC) No 676/2007 of 11 June 2007. The TAC for 2007 is 50,261 tonnes, compared with 57,441 tonnes in 2006, and 59,000 tonnes in 2005. Discarding of small plaice continues to be a problem. In *sole*, the fishing rate has fluctuated well above the precautionary level, but periodic good year-classes have raised SSB above the precautionary level from time to time. SSB is currently below the precautionary level, and the fishing rate is declining but is above the rate that would lead to high long-term yields, so the TAC agreed for 2007 is 15,020 tonnes compared with 17,670 tonnes in 2006 and 18,600 tonnes in 2005.

#### 5.3.3 North Sea herring and mackerel

The North Sea *herring* stock, which collapsed in the 1970s and was closed to fishing for several years, subsequently recovered, and although it fell back in the mid-1990s, it has again been rehabilitated. SSB is now well above the precautionary level due to a moderate fishing rate on both juvenile and adult herring, coupled with two strong year-classes in 1998 and 2000. However, all year-classes since 2001 are among the weakest since the late 1970s. The TAC in 2007 is 341,063 tonnes compared with 454,751 tonnes in 2006 and 535,000 tonnes in 2005. In contrast, the North Sea mackerel stock has never recovered from the collapse of the 1970s, and the fishery remains closed except in ICES Division IVa at certain times of the year.

#### 5.3.4 English Channel flatfish

*Sole* stocks in the eastern and western Channel are biologically discrete stocks that are assessed and managed separately. In the larger, eastern Channel stock, the assessed fishing rate has been decreasing, and SSB has increased above the precautionary level, and the TAC for 2007 is 6,220 tonnes, compared with 5,720 tonnes in 2006 and 5,700 tonnes in 2005. In the smaller western Channel stock, the 2006 assessment is

somewhat uncertain, but it indicates that the fishing rate has remained close to the historical high, and that SSB has declined towards the lower limit,  $B_{lim}$ . Since 2003, ICES has advised a recovery plan for the western Channel sole stock and a multi-annual plan has been under development within the European Commission – final details are contained within Council Regulation (EC) No 509/2007 of 7 May 2007. The EU set a TAC of 900 tonnes for 2007, compared with 940 tonnes in 2006 and 865 tonnes in 2005. The *plaice* stock in the eastern Channel is linked to that in the southern North Sea but is separate from the western Channel. In the eastern Channel, the state of the plaice stock can no longer be assessed due to a divergence between the landings-at-age and survey-based indices. In the western Channel the fishing rate in 2006 reached its maximum historical level, and the SSB is below the precautionary level. Following ICES advice in 2006, the combined eastern and western Channel plaice TAC for 2007 is 5,050 tonnes, compared with 5,151 tonnes in both 2006 and 2005.

### 5.3.5 Westerly anglerfish and megrim

The two *anglerfish* species ('black' and 'white') are caught together, but the main catches are of the species *Lophius piscatorius*. SSB has remained consistently above the precautionary level since the mid 1990s. The fishing rate has fluctuated around a declining trend but is now below the precautionary level. The 2006 ICES advice is to reduce the fishing rate on both species to the precautionary level, but given the recent good recruitment and subsequent increase in SSB, the 2007 TAC for ICES Subarea VII and Divisions VIIa,b,d,e was set at 36,000 tonnes, compared with 33,918 tonnes in 2006. The area VII share of the 2007 TAC is 28,080 tonnes (of which up to 5 per cent may be fished in Divisions VIIa,b,d,e).

The status of *megrim* is unknown. Different data sources give conflicting information on the development of this stock. Landings have remained stable and the 2007 TAC for ICES Subarea VII and Divisions VIIa,b,d,e is 20,425 tonnes, the same as in 2006, compared with 21,500 tonnes in 2005. The area VII share of the 2007 TAC is 18,300 tonnes.

### 5.3.6 Northern hake

Northern *hake* is widely distributed along the western seaboard, but is assessed as a single stock. During the 1980s and early 1990s landings, recruitment and SSB all declined as the assessed fishing rate increased to high levels in the 1990s. Although the fishing rate on hake is lower than that on the cod and haddock stocks, it has in the past included a component on young hake that has contributed to the poor stock status. In 2000, ICES called for a recovery plan, and over the last few years the EU has restricted the TACs, increased the main hake mesh size to 100mm, and restricted fishing in nursery areas south of Ireland and in the Bay of Biscay. More recently, the European Commission has enacted a Council Regulation (EC) No 811/2004 that establishes measures for the recovery of the northern hake stock. The 2006 assessment indicates that the fishing rate is below the precautionary level, and that SSB is just above the precautionary limit. The TACs agreed for 2007 were 29,541 tonnes for ICES Division Vb (EC waters) and Subareas VI, VII, XII and XIV, and 19,701 tonnes for ICES Divisions VIIa,b,d,e, compared with 24,617 tonnes and 16,419 tonnes,

- respectively, in 2006 and 23,888 tonnes and 15,932 tonnes, respectively, in 2005.
- 5.3.7 Northeast Atlantic mackerel
- Mackerel* is assessed as the single Northeast Atlantic (NEA) stock which combines the Southern, Western and North Sea spawning components. SSB has been remarkably stable over the last two decades, with a slight decline since 2001. The stock is classified as being harvested unsustainably and the 2003 year-class is estimated to be low. There is insufficient information on the size of the 2004 and 2005 year-classes. The advice is to reduce the fishing rate on NEA mackerel to the precautionary level, whilst maintaining measures to protect the North Sea spawning component. The TAC agreed for 2007 is 422,551 tonnes compared with 415,824 tonnes in 2006 and 420,000 tonnes in 2005.
- 5.3.8 Western cod
- The fishing rate on the stock of *cod* occupying the western Channel, Celtic Sea and Western Approaches may have fallen in recent years from historical levels similar to those found in the North Sea but the precise level is uncertain due to recent changes in discarding practices. Historically, recruitment has been highly variable, but indications from survey data suggest that recent recruitments have been low. The TAC for 2007 is 4,743 compared with 5,580 tonnes in 2006 and 6,200 tonnes in 2005.
- 5.3.9 Irish Sea roundfish
- The *cod* and *whiting* stocks in the Irish Sea are seriously depleted, and landings fell rapidly during the 1980s and 1990s. The fishing rate has been very high, spawning stocks have fallen below both the precautionary and the lower limit level, and the abundance of young cod and whiting has been in decline since 1990. After 2000, the EU significantly reduced the *cod* and *whiting* TACs, closed the cod spawning area in the western Irish Sea during the spawning season, and increased the main whitefish mesh size to 100 mm. The 2006 *cod* assessment, which is rather uncertain, suggests that the stock is still over-fished. The European Commission has enacted a Council Regulation (EC) No 423/2004 that establishes measures for the recovery of cod stocks. The cod TAC agreed for 2007 is 1,462 tonnes (compared with 1,828 tonnes and 2,150 tonnes in 2006 and 2005, respectively). As in 2005, there is no *whiting* assessment in 2006 but long-term information on the historical yield and catch composition indicates that the present stock size is low. ICES continues to advise a recovery plan with a zero catch option. The TAC for 2007 is 371 tonnes (compared with 437 tonnes and 514 tonnes in 2006 and 2005, respectively). In the relatively new fishery for *haddock*, landings have declined since the peak of 1998 although total landings since 2004 are uncertain. No reliable assessment is available for the stock but the fishing rate remains at a high level relative to taking high long-term yields. The TAC agreed for 2007 is 1,179 tonnes (compared with 1,275 tonnes and 1,500 tonnes in 2006 and 2005, respectively).
- 5.3.10 Irish Sea flatfish
- The fishing rate on Irish Sea *plaice* has declined significantly over the last decade and is now below the precautionary level, with SSB above  $B_{pa}$  after a period of low SSB associated with low recruitment through the 1990s. The plaice TAC agreed for 2007 is 1,849 tonnes (compared

with 1,608 tonnes in 2006 - the same as in 2005, but with an additional 15 per cent that could have been fished between 1 June and 30 September 2006). The Irish Sea sole fishing rate is above the rate that would lead to high long-term yields but commercial CPUE indicates a stable stock situation in recent years which is confirmed by survey information. The sole TAC agreed for 2007 is 816 tonnes, compared with 960 tonnes in both 2006 and 2005.

### 5.3.11 West of Scotland roundfish

The *cod* and *haddock* stocks west of Scotland are heavily overfished with respect to the rate that would lead to high long-term yields. The state of *whiting* is uncertain, but all indicators suggest that the stock is low. Survey SSB estimates indicate that cod and whiting stocks have been declining in recent years. ICES called for a recovery plan in 2000, with low or zero catches, and the EU has since cut the *cod* and *whiting* TACs significantly, implemented two small closed areas, and in 2003 increased the main whitefish mesh size to 120 mm in line with the North Sea. More recently, the European Commission has enacted a Council Regulation (EC) No 423/2004 that establishes measures for the recovery of cod stocks. The TAC for 2007 is 490 tonnes for cod (compared with 613 tonnes and 721 tonnes in 2006 and 2005, respectively), and 1,020 tonnes for whiting - a reduction from 1,360 tonnes in 2006. Based on the most recent estimate of SSB and fishing rate *haddock* is harvested unsustainably. The very strong 1999 year-class has caused SSB to increase from its historic low in 2000 to above precautionary levels since 2001. The TAC for 2007 is 7,200 tonnes (compared with 7,810 tonnes and 7,600 tonnes in 2006 and 2005, respectively).

## 6 Overview of the fishing industry in Europe

### 6.1 The European fishing fleet

Table 6.1 shows the composition of the European Union fishing fleet as at 31 December 2006.

There were around 81,000 vessels in the original 15 member states of the EU at the end of 2006. The total size of the EU fleet, allowing for the ten new member states joining on 1 May 2004, is around 87,000. Greece, Spain and Italy have 52 per cent of the total EU fleet and the UK has 8 per cent. Under 12 metre vessels account for 94 per cent of the Greek fleet and Spain and Italy account for 51 per cent of all vessels in the EU of 12 metres or over.

**Chart 6.1 European fleet by nationality of vessel: 31 December 2006**

### 6.2 EU fleet, quotas and uptake

Table 6.2 shows the 2006 European Union Total Allowable Catch (TAC) and quota (after exchanges etc) for each stock, together with landings by each member state. These are derived from reports to the European Commission by each member state detailing landings into their own country by their own vessels and those of other member states. The figures may therefore differ from those for the UK reported in Chapter 3, which are based solely on the UK's record of landings into the UK and abroad.

(a) Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock VII, VIII, IX, X.

(a) Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock VII, VIII, IX, X.

(a) Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock VII, VIII, IX, X.

[a] Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock VII, VIII, IX, X, XI and XII.

(a) Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock VII, VIII, IX, X.

(a) Landings outside the UK were reported by other member states. Figures in Chapter 3 for UK vessels landing abroad are based on UK records and so figures in this table for species fully covered by quota stocks may differ from those in Chapter 3. It should also be noted that landings shown against stocks with zero quota are also recorded against the main quota stock, e.g. landings for Haddock Vlaa are included in the stock Haddock VII, VIII, IX, X.

## 7 Overview of the world fishing industry

### 7.1 World catch

The world catch data (Tables 7.1 and 7.2) presented in this chapter have been extracted from the most recently available data from the Food and Agricultural Organisation of the United Nations (FAO). These tables present the annual statistics, for six years ending in 2005, on a world-wide basis, of nominal catches (See Appendix 1, Glossary of terms).

The world catch figures from marine fishing areas fell by 2 per cent from 85.5 million tonnes in 2004 to 83.7 million tonnes in 2005.

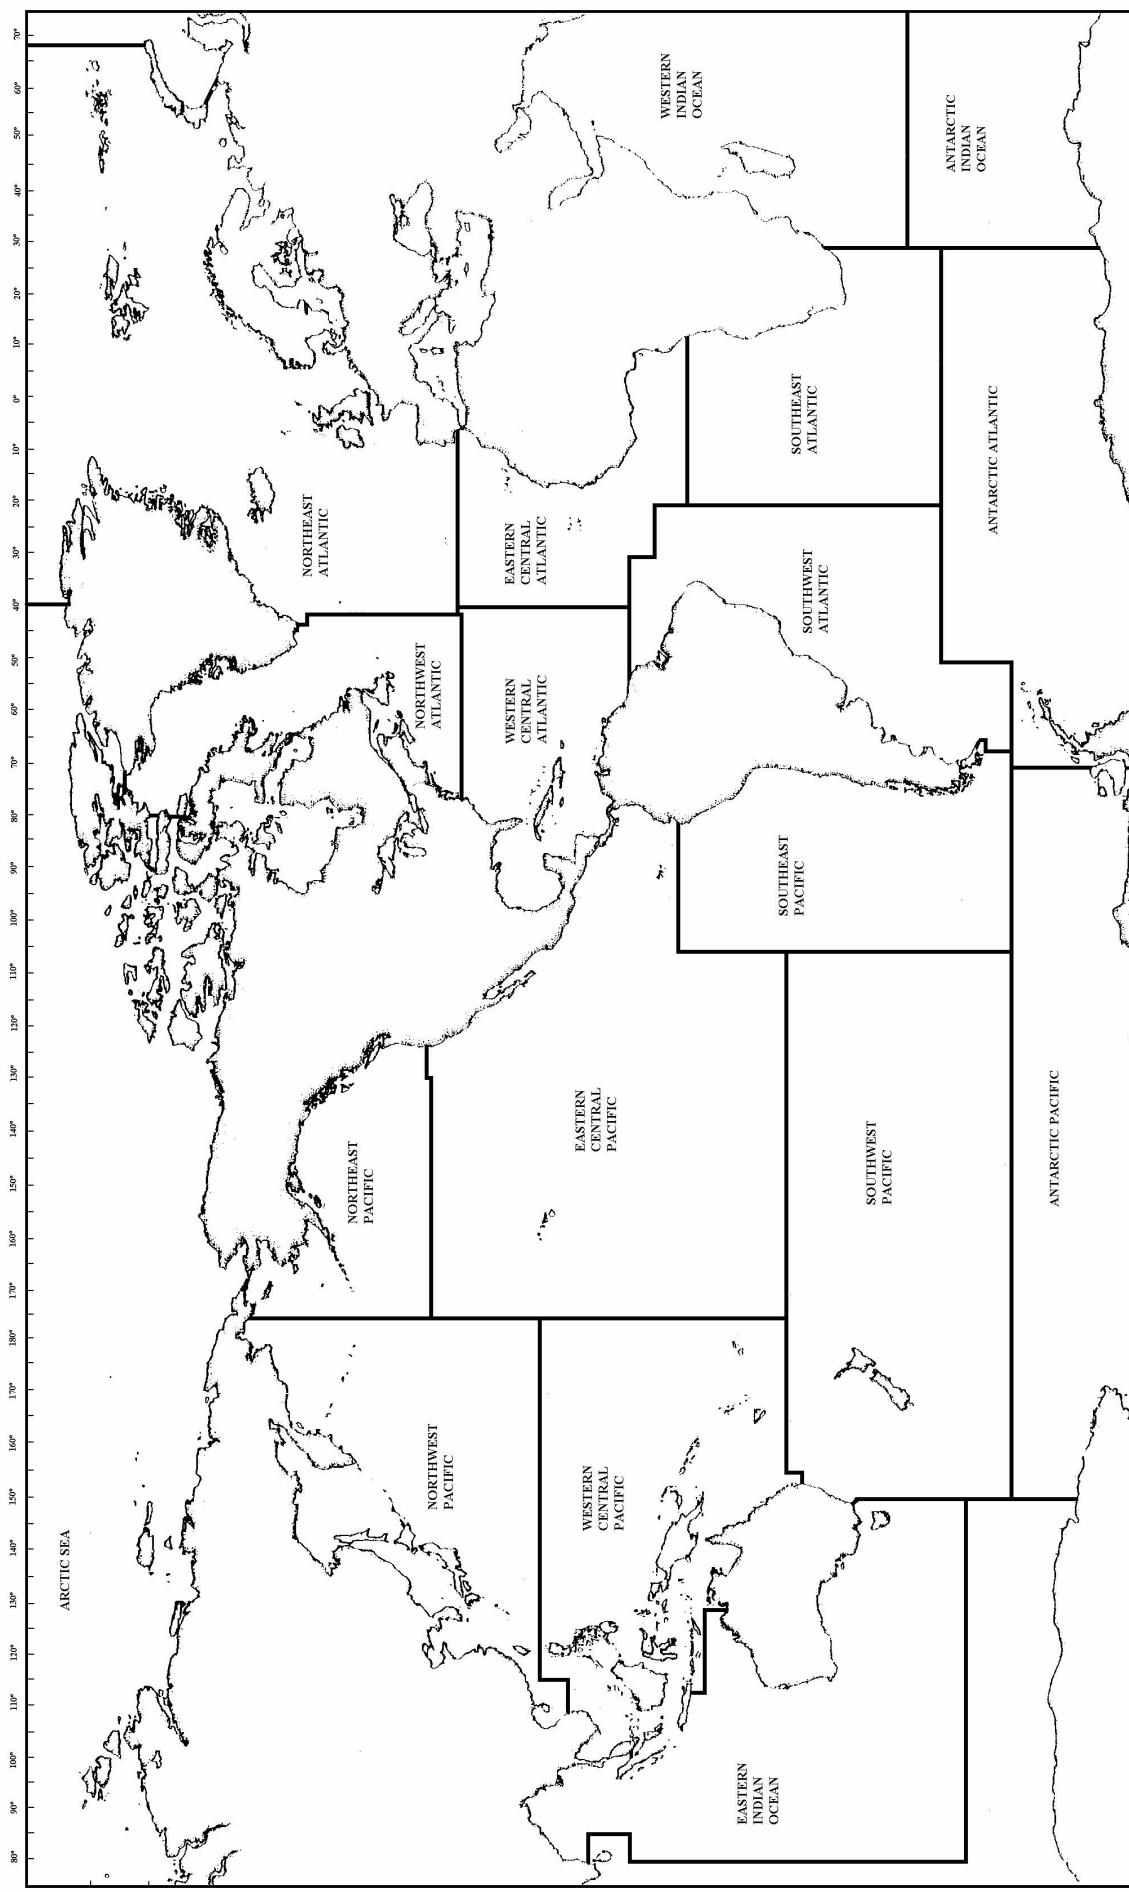

In 2005 China caught the largest volume of fish, 14.7 million tonnes. Peru had the second largest annual catch at 9.3 million tonnes. The USA, Japan, Indonesia and Chile each caught between 4 and 5 million tonnes.

Of the 83.7 million tonnes of fish caught in 2005, 63 per cent were caught in the Pacific Ocean, 26 per cent were caught in the Atlantic and 11 per cent in the Indian Ocean.

Marine catches from the Pacific Ocean have shown a long-term gradual increase reaching a maximum of 53.6 million tonnes in 2000. Landings in 2005 were 52.5 million tonnes, a decrease of 1 per cent on 2004.

In the Atlantic, the 2005 catch is 12 per cent lower than in 2001. Overall, in the Atlantic Ocean, marine catches have tended to fluctuate between a low of 22.7 million tonnes (1991) and a high of 26 million tonnes (1976). In the Indian Ocean, marine catches have generally increased from 6.8 million tonnes in 1991 to 9.5 million tonnes in 2005.

# Appendix 1: Glossary of terms

<b>Demersal</b>	The term demersal fish covers species living on or near the sea bed.
<b>Exports</b>	Exports consist of the outward movement of goods produced by businesses in the UK, plus goods, which after importation, move outward from bonded warehouses or free zones without having been transformed i.e. both exports and re-exports. Export statistics exclude fish caught by domestic fishing craft, whether or not processed on board, landed in foreign ports.
<b>Fishing areas</b>	Fishing areas are defined by international convention. The immediate waters around the UK are subdivided into ICES Sub-areas IV (North Sea), VI (West of Scotland) and VII, and its divisions (Western Approaches, VIIg,h; the Irish Sea, VIIa; and the Channel, VIId,e).
<b>Fishing capacity</b>	Fishing capacity is the physical dimension of fishing vessels measured in tonnage, kW or VCU.
<b>Fishing effort</b>	Fishing effort is a measure of the fishing activity of vessels based on fishing capacity and the time spent fishing. It may be expressed in tonnage days, kW days etc.
<b>Fishing mortality</b>	Fishing mortality is the proportion off a stock killed/dying each year as a result of fishing activity.
<b>Fixed gears</b>	Fixed gears are mainly used for demersal species. They are normally vertically hung curtains of netting which enmesh or entangle the fish, fixed to the seabed with anchors or weights and held upright with floats.
<b>GRT</b>	GRT (Gross Registered Tonnage) is a general term applied to a range of volumetric measures of vessel capacity.
<b>GT</b>	GT (Gross Tonnage) is a volumetric measurement of vessel capacity under the rules of the ITC69 (International Tonnage Convention). By the end of 2003 all UK fishing vessels over 15m overall length must have their tonnage measured on this basis.
<b>GT*</b>	GT* is an estimate of fleet tonnage for vessels as it would be measured under the rules of ITC69. A set formula derives the estimate from the physical characteristics of the vessel. The estimate is used in place of an actual measured gross tonnage for all vessels under 15m overall length and for those vessels over 15m that have yet to be remeasured.
<b>Imports</b>	Imports consist of all goods moving into a country, including goods for domestic consumption and goods into bonded warehouses or free zones. In accordance with the internationally recommended practice, import statistics include fish caught by foreign fishing craft, whether or not processed on board, landed in domestic ports.

<b>Nominal catches</b>	Nominal Catches consist of fish, crustaceans, molluscs and other aquatic animals, taken for all purposes (commercial, industrial and subsistence) except recreational, operating in inshore, offshore and high seas fishing areas (marine fishing areas). Inland waters, both fresh and brackish, are excluded. In view of the difficulty of distinguishing in many cases between recreational and subsistence fishing, figures may include recreational catches. Nominal catches refer to the landings converted to a live weight basis. There are many instances where the catches on board fishing vessels or factory ships are gutted, filleted, salted, dried, etc., or reduced to meals, oil, etc. The data on the landings of such species and products require conversion by accurate yield rates (conversion factors) to establish the live weight equivalents at their time of capture.
<b>Pelagic</b>	The term pelagic fish covers species found mainly in shoals in midwater or near the surface of the sea.
<b>Purse seining</b>	Purse seining is a method used exclusively for pelagic operations. A very large, deep net is shot around a fish shoal and is then closed, or pursed, at the bottom to trap the fish. The net is then hauled upwards to concentrate the fish near the surface, and the fish are taken on board using a separate lifting net or pump.
<b>Recruits</b>	Recruits are the young fish in the year class which is entering the fishery.
<b>Seining</b>	Seining is a method used exclusively for demersal fishing. The net, lighter than for trawling, is set on very long ropes designed to herd or contain the fish for capture in the net. After the fish have been surrounded by the ropes, the net is slowly hauled back to the vessel.
<b>Shellfish</b>	The term shellfish covers all crustaceans and molluscs.
<b>Spawning stock biomass (SSB)</b>	The spawning stock biomass (SSB) is the total weight of a species population capable of reproducing.
<b>Stock</b>	A stock is that part of a species population exploited in a defined fishing area.
<b>Trawling</b>	Trawling may be used either for bottom-dwelling (demersal) or mid-water (pelagic) species, the net being of a basic funnel-shaped construction and towed behind a vessel or between two vessels (pair trawling).
<b>VCU</b>	VCU (Vessels Capacity Unit) is calculated as follows: the overall length of the vessel in metres is multiplied by the breadth of the vessel in metres. This figure is then added to the power of the engine in kilowatts multiplied by 0.45.
<b>Year class</b>	A year class is the young of any one annual spawning.

## **Appendix 2: UK fisheries statistics methodology**

### **Organisation of the national system of fisheries statistics**

Fisheries data are mostly collected by officers in the Sea Fisheries Inspectorates and processed by officials of the various Fisheries Administrations in the UK, namely the Marine and Fisheries Agency (MFA) (for England and Wales), the Marine Directorate, Scottish Executive and the Department of Agriculture and Rural Affairs for Northern Ireland (DARD) and Departments in Jersey, Guernsey and the Isle of Man.

The main legislation used is:

- (i) the EU fisheries legislation on keeping and submitting logbooks and providing landing declarations and sales notes - Council Regulation (EEC) No. 2847/93 (as amended) and Commission Regulation (EC) No 2807/83 (as amended).
- (ii) general powers under the Sea Fisheries (Conservation) Act 1967 under which Ministers granting a licence can require the master, owner or charterer of the vessel named in the licence to provide him with such statistical information as he may direct. These powers were widened in the Sea Fish (Conservation) Act 1992 to cover other types of information and the form in which it is to be supplied.

The MFA collates the information compiled by Fisheries Administrations in the UK for this publication.

### **Method of collecting, processing and compiling the data on catches, landings and average prices**

**Sources of data** - The sources include logbooks, landing declarations, sales notes and personal contact with fishermen and merchants. Port harbour masters also provide details of individual vessels landing at main coastal locations. The method used for collecting data depends upon the size of vessel and location of landings. Legislation covers the supply of data on log sheets for all vessels over 10 metre overall length in respect of catches of all species. Much information on the value of catches is provided by the industry in the form of sales notes. For vessels under 10 metres overall length, there is no statutory requirement under either EU or national legislation for fishermen to declare their catches. Historically, information for this sector has been collected with the co-operation of the industry: it comprises log sheets and landing declarations voluntarily supplied by fishermen as well as sales notes and assessments of landings derived from market sources and by correspondents located in the ports. This collection of data has now been replaced after the introduction in September 2005 by UK Fishery Departments of a scheme of registration for buyers and sellers of first sale fish and designation of fish auction sites. This requires sales notes

related to these sales to be reported to Fisheries Administrations, which are used in addition to the voluntary information from fishermen.

Full documentation is not required for most fishing for non-TAC species, including shellfish. During 2005 and 2006, UK Fisheries Administrations introduced a system of restrictive licensing for activity targeted at shellfish. As part of this system, new reporting requirements were introduced involving a requirement for fishermen to complete diaries of their daily activity which need to be submitted on a monthly basis. Summary information from these diaries is now in use, in addition to sales notes and other information supplied voluntarily by the industry, and from a variety of local sources and surveys run by local Sea Fisheries Committees.

**Landings abroad** - UK vessels which land at foreign ports are required under EU legislation to dispatch copies of log sheets and landing declarations covering their trips to the vessels' home ports within 48 hours of landing. When these data are received at the home port, they are entered on the systems used for UK landings.

**Attribution of area of capture** - Details of the areas fished are taken from the logbooks and codes for the ICES divisions and statistical rectangles are keyed into the port micro-computers. Where a statistical rectangle is split into different areas (e.g. part is in EU waters and part in the Norwegian waters) an additional code is used to indicate the zone fished. The detailed codes are available on the central computer records. Where a vessel fishes in more than one area in a single trip, the total amounts for the trip of each species, as given in the sales notes and landing declarations are allocated to the areas in proportion to the estimated quantities of the species taken from each area, as recorded in the logbook. For the few landings from distant waters, the coding of the areas is less detailed but sufficient to identify the quota concerned.

**Value of landings and average price data** - Sales note information has been routinely provided for landings into Scotland. For landings into England, Wales and Northern Ireland much information was already supplied by fishermen, and this has increased with the introduction of requirements for buyers and sellers of fish to report sales notes (see above), with these including details on the grade and freshness as well as the quantity and value of fish sold. Average prices are derived using the presentation codes of the landings and the average values and quantities landed.

**Data capture and processing** - The inspectors at port offices carry out a mix of manual and automatic checks on the information provided by vessel operators. These include a check between logbook information and that given in the sales notes or observed as landed as well as checks against other sources of information (e.g. satellite position reports as well as sales notes provided by buyers of fish). Information from log sheets, landing declarations, sales notes and other sources are then keyed into micro-computers connected to the main databases by government staff at port offices. The catch data are used to apportion

information from the landing declaration/sales note which is keyed separately. The fishing records are transmitted to the central computer systems where further checks are carried out on the data before they are reflected on the main landings databases.

Catch and landings statistics for the UK are compiled from the systems run by the MFA and the Marine Directorate, Scottish Executive. The former holds information on all landings into England, Wales and Northern Ireland by UK vessels and of landings abroad by vessels administered by the MFA and DARD while the latter provides figures for landings into Scotland by all UK vessels and landings abroad by the Marine Directorate, Scottish Executive administered vessels.

### **The reliability and completeness of the data**

**Completeness** - The collection system for all vessels over 10 metres attempts a complete coverage of all main fishing activity. Sales note information is used for Scottish 10 metre and under vessels and from 2006 is also being used in England and Wales (see above comments). In the past, estimates of the fishing activity by vessels under 10 metres and for some shellfish related activity were made on the basis of local knowledge. With the move to use data on sales notes as a source of information on the activity of these vessels as well as newly introduced monthly diaries of activity relating to fishing for shellfish, data collection on the activity of these vessels is regarded as having been significantly improved.

**Reliability** - The reliability of the statistics is dependant upon the veracity of the documentation provided by fishermen. There are systems of surveillance using sightings by aircraft and by fisheries protection vessels and by satellite monitoring. This information is employed in checking the data.
